POPULAR SCIENCE DEC. 1946 25 CENTS MONTHLY

ful, more practical

than ever before!

Gain a complete mastery of MATHEMATICS

Get a better job in America's great industries, and prepare to seize your coming opportunities—learn mathematics. Mathematics is the basic requirement of all mechanical and scientific work, and of all business or industry based on science. Without this essential knowledge even the most capable man is left behind while others forge ahead to better jobs, bigger contracts, more money.

You need mathematics to understand all technical work, to supervise operations, to improve, speed up and check on your work and the work of others.

Such basic training is quickly recognized today and gladly paid for. It singles you out from the crowd and gives you an advantage whether it is a matter of a job, a promotion or a contract. Now you can learn mathematics—the foundation of all technical work—by an easy, inexpensive and time-saving method. A very simple and extremely interesting course in book form has been prepared for you by an expert who has devoted a lifetime to teaching practical men the fundamentals of this important subject.

Get this Basic Training for Executives IN ONLY 10 MINUTES A DAY

Now you can gain all the benefits of a mathematical training if you will devote as little as ten minutes each day to these easy lessons. Spend only the time that is usually wasted, and you will be amazed how quickly you will notice an improvement in your all around efficiency—how soon you will feel a new impetus toward successful work in your business, your profession, or your industrial activity.

5 VOLUMES, 1,598 PAGES ILLUSTRATED

Every minute you spend on this complete course will pay you big dividends. It will give you the ability to grasp readily all basic business principles. It will help you develop the quick, accurate judgment that is essential to job advancement, to executive positions, to success!

EXAMINE THESE BOOKS FOR 10 DAYS FREE!

THIS PRACTICAL SELF-STUDY COURSE WILL QUICKLY GIVE YOU THE ESSENTIAL KNOWLEDGE FOR SO MANY OF TODAY'S JOBS IN BUSINESS AND INDUSTRY

MATHEMATICS for Self Study

By J. E. Thompson, B. S. in E. E., A. M., Dept. of Mathematics, Pratt Institute

A COMPLETE COURSE AND REFERENCE LIBRARY

NEW EDITION — More useful, more practical

These books start right from the beginning with a review of arithmetic that gives you all special short cuts and trick problems that save countless hours of your time and make you more valuable to yourself and your job. Then they go right into higher mathematics and show how simple it is when an expert explains it for you.

Don't let appearances fool you, mathematics is easy. You can get these books on approval and see for your-self how much enjoyment you will have while getting this valuable training and solving interesting practical problems that puzzle your friends and fellow workers. In no time at all you will be tackling with ease the most difficult question on this subject.

These are but a few of the hundreds of subjects simplified and explained in the new edition of this complete self-study course in mathematics.

ARITHMETIC 1 Starting with a quick review of principles, it presents all the special calculation methods used in business and industry. Fundamental in all computations in engineering, in both plant and field. Essential methods for rapid calculation such as is needed in setting lather, etc. Hundreds of other applications to technical work.

ALGEBRA: This volume makes algebra a live, interesting subject. It shows you, step by step, how to apply algebraic methods to the most complex problems. Explains how to solve problems which are involved in all business and industrial work relating to machines, engines, ships, autos, planes, etc. Logarithms and slide rule, and many other practical applications.

facts about plane figures, circles, polygons, etc., covers all the topics essential in drafting and engineering. It deals at length with angles, triangles, circles, and the many other geometric figures that are basic to engineering design. Sheet-metal work, so important in airplane construction, is a direct application of these principles.

TRIGONOMETRY: This volume makes easy the principles of angles and triangles, shows you how to use tables that explain their functions. Practically every problem in machine work, land surveying, mechanics, astronomy and navigation is solved by methods of trigonometry. These methods are explained simply, with actual examples of calculations of height and distance, the construction of buildings, bridges and dams, the cutting of gears, etc.

CALCULUS: You will enjoy mastering calculus in this interesting new way
and will find it will enable you to solve
problems that can be solved in no other
way. This branch of mathematics deals
with rate problems. It is essential in
computation involving objects moving
with varying rates of speed. It also enables us to find the most efficient design
for any kind of mechanism, engine, or
moving vehicle.

AN EXPERT GIVES YOU HIS SIMPLIFIED METHODS

Mr. Thompson, the author of these books, is not an ordinary teacher of mathematics. He has had many years' experience in giving students the kind of mathematical training they need in practical work. He presents each method and problem in the clearest and simplest way. He gets right down to the kind of information that you need in your daily work.

SEND NO MONEY

The coupon at the right brings you the 5 books for 10 days' trial. After 10 days, if not completely satisfied, return the books to us without obligation, if you keep them, send us the small down payment of \$2.95, balance in three monthly payments. Make this test at our expense. Mail the coupon today.

How to pass a genius

All of us can't be geniuses. But any ordinarily talented mortal can be a success—and that's more than some geniuses are.

Now, as in Æsop's time, the race doesn't always go to the one who potentially is the swiftest. The trained man has no trouble in passing the genius who hasn't improved his talents.

In good times and bad times, in every technical and business field, the trained man is worth a dozen untrained ones, no matter how gifted.

The International Correspondence Schools can't make you into a genius. For more than 50 years, however, I. C. S. has been helping its students to become trained, successful leaders—and it can do the same for you.

Mark your special interest on the coupon. Don't be like the unsuccessful genius who wastes his life in dreaming of what he intends to do. Act now!

Should Scientists Take An Oath?

(A Statement by the Editor of Popular Science Monthly)

FRESH-SHINGLED Doctors of Medicine commonly take the Oath of Hippocrates and thus subscribe to a code of medical ethics. There has been proposed a similar oath for scientists, whereby they would swear by whatever gods or immutable truths they hold sacred to work only for the welfare of mankind, and to avoid that scientific sin which is secrecy—military or national.

The idea has its merits. The orderly curiosity that is science is as international as the wind, and your true scientist is in the business of secret-smashing. It has also been suggested that an international priesthood of science might prevent war by some kind of scientific sit-down strike.

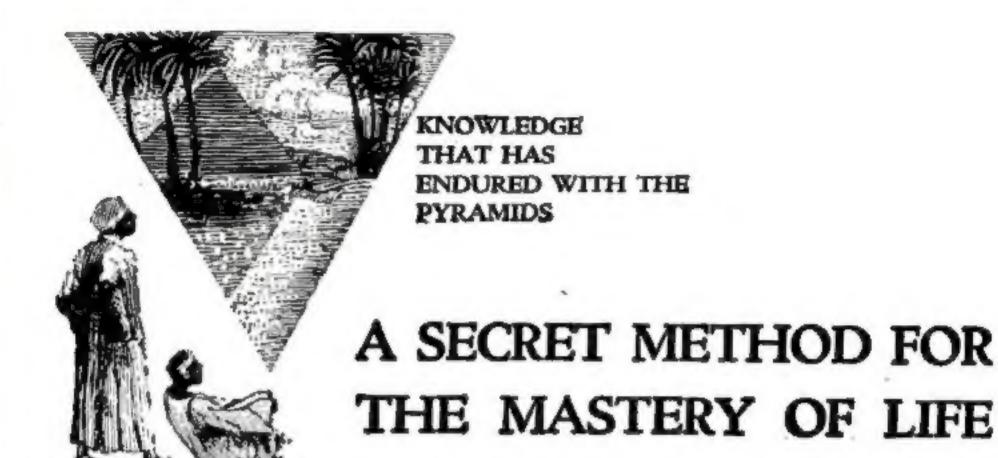

But the scientists are also discovering that they are people, too. And it is the scientist as a human being and a citizen who is shocked by his responsibility in the perversion of science to destruction. Furthermore, no scientists' oath to work only for the welfare of humanity could mean much for the simple reason that no one could foretell what any discovery would entail. A research into the cure of cancer, for instance, might ultimately reveal enough knowledge of the cause to make the dread disease another weapon.

If the scientist is to be the saviour of frightened, ignorant humanity, no negative oath will help. Our trouble now is that the socalled social sciences have not caught up with nuclear physics. We need to know why humans behave like animals; what makes people stupid, greedy, bloodthirsty; how to stop a war, or start a crusade for decent brotherhood.

An intensified inquiry into human nature calls for the best scientific brains in the world. And it's just about the only way to make biological warfare into the farmers' friend, or atomic bombs into doctors' tools.

Penny Githzas

1946

THENCE came the knowledge that built the Pyramids and the mighty Temples of the Pharaohs? Civilization began in the Nile Valley centuries ago. Where did its first builders acquire their astounding wisdom that started man on his upward climb? Beginning with naught they overcame nature's forces and gave the world its first sciences and arts. Did their knowledge come from a race now submerged beneath the sea, or were they touched with Infinite inspiration? From what concealed source came the wisdom that produced such characters as Amenhotep IV, Leonardo da Vinci, Isaac Newton, and a host of others?

Today it is known that they discovered and learned to interpret certain Secret Methods for the development of their inner power of mind. They learned to command the inner forces within their own beings, and to master life. This secret art of living has been preserved and handed down throughout the ages. Today it is extended to those who dare to use its profound principles to meet and solve the problems of life

in these complex times,

This Sealed Book-FREE

Has life brought you that personal satisfaction, the sense of achiever ment and happiness that you desire? If not, it is your duty to yourself to learn about this rational method of applying natural laws for the mastery of life. To the thoughtful person it is obvious that everyone cannot be entrusted with an intimate knowledge of the mysteries of life, for everyone is not capable of properly using it. But if you are one of those possessed of a true desire to forge ahead and wish to make use of the subtle influences of life, the Rosicrucians (not a religious organization) will send you A Sealed Book of explanation without obligation. This Sealed Book tells how you, in the privacy of your own home, without interference with your personal affairs or manner of living, may receive these secret teachings. Not weird or strange practices, but a rational application of the basic laws of life. Use the coupon, and obtain your complimentary copy.

 ${f IP}$ you are doing the "chore" work, of accounting as a bookkeeper, ledger clerk, cost clerk, or in one of the other many record keeping jobs-

You should consider climbing higher—becom-

ing an accountant.

Why be satisfied all your life with a small salary and an ordinary job when there is such a large future for the man or woman who understands accountancy in all its forms and phases?

One big difference between you and the successful accountant is that he doesn't do the chores. He bosses those who do the drudgery and he gets the money and prestige. And he does that because he knows the principles behind the records you keep-can plan those records and interpret them to management. He knows what you know—and a lot more.

There are two ways in which you can get this knowledge which will qualify you for an accountant's position.

First—the old way of day-by-day experience on the job. This is the long route—taking many, many years, sometimes a lifetime. Most people taking this way never get anywhere. Why sacrifice years of success—lose time and money—when there is a better and easier way?

Second, the LaSalle way of learning in your spare time studying and preparing for the step ahead. You learn by doing-you study accounting principles and solve accounting problems. You cover accountancy from the basic principles right up through Accounting Systems and Income Tax Procedure—C.P.A. training if you so desire.

Are YOU doing bookkeeping "chores"?

CLIMB HIGHER!

As you go along you absorb the principles of auditing, business aw, statistical control, cost accounting, organization, management and finance, etc.

This way is not magic, It is not easy. It requires giving up certain spare time to serious study. How long will it take you to acquire

this accountancy training is strictly up to youyou can go as fast or as slowly as you choose. But after you have gone part way (you need not wait until you are clear through the training) you will find yourself stepping up to better positions.

And once you have mastered this fascinating profession—once you have become an accountant -then you will have the money and the standing to make your dreams come true. You will be a respected member of the best paying profession and equipped to go out into public accounting or to climb to a top management position,

Our free 48-page booklet, "Accountancy, the Profession That Pays," tells you what you must know to be an accountant and how you can prepare in your leisure time at moderate cost. The coupon below will bring this booklet quickly without cost or obligation. You already have a start in this field; now find out how you can go all the way. Do it today.

The patent laws provide that any new and useful art, machine, article of manufacture, composition of matter, or design, or any new and useful improvement thereof, may be patented if the act of invention is involved. Therefore, every inventor with a valuable invention should take advantage of the patent laws and proceed for patent protection in order to safeguard his rights.

A patent gives the inventor the exclusive right to prevent others from making, using, or selling the invention claimed in the patent for a period of 17 years.

The patent laws were enacted for the benefit of the inventor to give him protection for the features of his invention which are patentable. These features must be properly and concisely set forth and claimed in a formal application for patent in order to comply with the requirements of the U. S. Patent Office. For that reason, the Patent Office advises the inventor to engage a competent registered patent attorney to prepare his application for patent and represent him before the U. S. Patent Office Examiner.

A specially prepared booklet containing detailed information with respect to patent protection and procedure will be forwarded to you without obligation upon request.

FOPULAR

Tricky Meters

Sir:

In your September article on how to read gas and electric meters—my daily job—I noticed that the examples did not include the thing that makes meter reading hard and catchy. Here is an example to show what I mean:

Many people would read it as 6294, but they would be wrong. It really reads 6194, because the second dial from the right has not reached the 0; so the third dial from the right is not a 2, as it appears, but is rightfully a 1.... I read an average of 160 meters a day, and I wager I'll find at least 20 of the tricky type. A hand can become loose at the pivot, causing it to slip ahead coming down from the 0 and fall behind on its way up after passing the 5.

Henry Harrison, Jr.

Pawtucket, R. I.

Sir:

register 5,883,000 cubic feet for the four-dial meter and 328,000 for the three-dial meter. This is incorrect. The four-dial meter registers 588,300 cubic feet; the three-dial meter, 32,800 cubic feet. Incidentally, I read over 100,000 meters a year.

HERBERT ZIELKE

Bronx, N. Y.

What with slipping hands and erroneous extra zeros, meter reading is tricky. PSM's thanks to two experts.

More Waste at Work

Sir:

Readers of your interesting article, "Putting Waste to Work in the Air," (PSM, July '46, p. 112) may be interested in another

INVENTORS

The Rules of Practice of U. S. Patent Office advises—unless the inventor is qualified to handle such matters—that he employ the services of a competent Patent Attorney in the preparation of his Patent Application. We are Registered Patent Attorneys fully qualified to represent you at the Patent Office. Our long and varied experience in patent practice, we believe, enables us readily to understand inventors' disclosures, to advise what is probably patentable, after conducting preliminary patentability investigation of prior U. S. patents, and to draw your specifications and claims in such manner as to present clearly the novel features.

Patent Laws Favor the Inventor Who Acts Promptly

Remember, the details of your invention do not have to be 100% perfect before you can obtain patent. Unwise inventors often devote considerable unnecessary time working on unimportant details of their devices. This is expensive, hazardous and unnecessary. First step is to have us conduct search for the prior U.S. patents and render a report as to its patentability. Our Search Report is very valuable to you in that it clears up the course you should take in regard to your invention. If our Report is favorable, this report of the patentability of your device shows that your chances of patent protection are in your favor.

Have Patent Protection First

Unless you safeguard your invention by obtaining a patent, thereby securing a monopoly on same, it may become "public property," free to be made, used and sold by anyone, or it may be patented by some other person.

utilized in our FR-1 Fireball—"jet pump augmented cooling." Basically, this amounts to getting extra cooling for your engine by exhausting the engine gases just within the edge of the cooling air exit slots. As the hot exhaust rushes from the stacks, it pulls some of the air surrounding the stacks along with it in a sort of jet pump action. As the air at the rear of the engine nacelle rushes out with the engine gases, a partial vacuum is created near the forward section of the engine that helps pull more cooling air through the cowling and past the cylinders. One of the reasons why we were able

function of escaping gases that we have

One of the reasons why we were able to enclose the forward engine of the Fireball so completely was this augmented cooling by jet pump action. We also used jet thrust from the exhaust to get added speed. It sounds almost like the story of using every part of a pig in the slaughterhouse.

WILLIAM P. BROTHERTON

Technical Editor
Ryan Aeronautical Company
San Diego, Calif.

No Grading Ring

Sir:

In your October issue, an illustrated writeup regarding our ball-grading machine . . .
referred to "grading rings" whereby the
steel balls are guided to numbered chutes.
. . . The picture to which you referred
represents an exaggerated cross-section of
a ball bearing, showing the result of using
one oversized ball in a bearing assembly.
Whit Hillyen

Bell & Howell Company Chicago, 1ll.

PSM stands corrected.

Light on Filters

Sir:

... What prompted me to write this letter was Kenneth S. Johnson's article, "Filters... Magic Eyes of Photography," in your September 1946 issue. I have read quite a bit on this matter in other books and have talked to salesmen about filters. Still, my mind wasn't too clear on this theory—until Mr. Johnson's article put the light on in my mind. His method of explaining is very clear and concise....

THEY BUILT THEIR OWN

MANY veteran students are now attending N.Y.T.I. of N.J. under the generous provisions of the G.I. Bill of Rights, which allows any approved school of the veteran's choice to charge the Veterans Administration up to \$500 a school year against the educational expenses of qualified veteran students. Full-time students, with dependents, are also paid a sub-

Student Walter E. Stevens, making engineering checks with \$395.00 United States Television Sweep Generator. The school is law skiy equipped with the most advanced test equipment,

sistence allowance of \$90 monthly by the VA, and those without dependents, \$65. Many students hold part-time jobs, thus augmenting their monthly payments. However, you do not have to be a veteran to be accepted as a student.

A considerable number of out-of-state students attend the school because of its excellent, practical type of radio and television courses,

so difficult to get anywhere else in the world today. Living quarters are obtainable by single students, but married students report considerable difficulty in finding quarters for their families.

No high-school diplomas are required. Every student must have at least a grammar-school education, however. And the school requires that a student be earnest, sincere and technically inclined. Students without proper mathematical backgrounds are taught the radio and television mathematics they need.

You probably have been wondering what N.Y.T.I. of N.J. means. It stands for the New York Technical Institute of

22 SCIENCE

An Advanced Class in Television at N.Y.T.I. of N.J., famous television school, and the 17-tube television sets they built. Students at this school have been building television sets as part of their courses since 1939, when television programs were first broadcast regularly. School officials

found that this practical method of instruction is productive of very satisfactory results. Each student may build a set and keep it to use in his own home laboratory, if he chooses to. The school is located in the heart of the radio, television, electronics industry.

TELEVISION RECEIVERS!

New Jersey, a resident school located in Newark, N. J., just across the river from New York City (Only 20 minutes from Broadway by subway or train). The school is located in the heart of America's great radio and electronics industry. Such leading television, radio and electronics manufacturers as Western Electric, Du Mont, Federal and Edison are nearby. Newark also is near Radio Stations WJZ, WEAF, WABC and WOR; each a leader in broadcasts going on networks all over the country. This means that the school offers numerous advantages, as it is in touch with most recent develcoments in radio and television. This

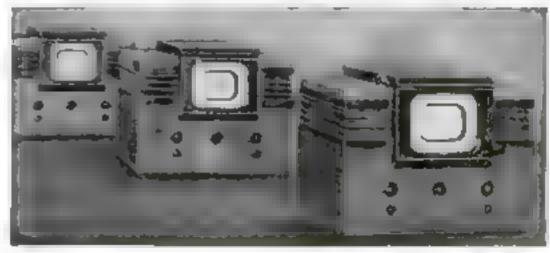

opments in radio and television. This also means that qualified radio and television engineers are available to the school for teaching purposes.

During the war N.Y.T.I. of N.J. was approved for the training of Signal Corps personnel by the Army. When the war ended the enrollment increased because of the influx of veterans desirous of getting practical television training. At the present time, there are

120 openings for new students for the several classes beginning in October & November 1946.

The school issues a special Bulletin, Numbered 312, which illustrates and describes its facilities and equipment and shows students using its varied laboratory equipment. Bulletin 312 also describes classes that may be attended, housing conditions, costs, hours, etc. To get complete information write for Bulletin 312 (for which no charge is made) to the New York Technical Institute of New Jersey, 158 Market Street, Newark, New Jersey.

A line of RCA television receivers used for comparative test purposes at N.Y T.I. of N.I.

SO IT NEEDS FIXING

By S. T. CHRISTENSEN

the "Fix-it-Man"

"WELL, I guess I'm the fellow to see, for Y I've repaired thousands of refrigerators (home and commercial both), vacuum cleaners, radios, washing machines, irons, fans, lamps, mangles, motors, etc. In fact, many of my customers call me their "electrical appliance doctor." And "doctoring," I might add has paid me a good substantial income for quite a few years. Funny, in a way, how I got started. Always liked to tinker and by experimenting around I found that most electrical appliances had many things in common. That, regardless of what the appliance was used for, or who the manufacturer was, the basic principles were much the same. From fixing my own appliances to fixing friends' and then for strangers at a fee, seems now to have been but a small step.

What to Charge?

At first, I let the owner decide the charge and, frankly, I was amazed at what I carned per hour. But then, when one figures what initial costs are involved in buying most electrical appliances, one can readily see that spending extra dollars for repairs is well worth while. Before long I was making more in my spare time repairing than from my regular job. The result . . . I went into business for myself. When war came, business boomed, for new appliances were not available.

For a while, repair parts (needed on some jobs) were a little difficult to get. But that

aituation quickly adjusted itself and many repair parts were given the high priority rating of AA2. After all, we had to provide for the health and well-being of our civilian population.

The Future Offers

Friends ask me about my future. And, I think I've got a grand one. Age is no handicap in repairing. I have in my files enthusiastic letters from repairmen ranging in age from 18 to 79 years. Now the war is over we are certain to see hundreds of new products on the market . . . products that the average person never dreamt of. These new products and our old appliances are all going to need at some time or other "fixing." Well, I'll still be the fellow to do it. The field open for appliance repairmen is unlimited. I don't worry at all about too much competition.

If You Are Ambitious

To the contrary, I've prepared a complete course, chuck full of simple, easy to understand photos and drawings and written in the same non-technical language as this article I know the course is good, because I have hundreds of men all over the country writing to me telling me how the course has helped swell their pockets with cash. If you too want to prepare now for your future, I suggest you read the next page and send me the handy coupon."

a repairman to charge on the basis of \$5.00 to \$6.00 per hour. Don't gamble with your future-learn a trade that will always support you. Remember. as long as electrical appliances are used, there will be a need for electrical appliance repairmen.

If you are at all mechanically inclined—can hold and use tools—then you have all of the qualifications required for becoming a big money earning home appliance repairmen. It does not matter if you have not had a great deal of achooling or had previous experience along these lines-WE WILL TEACH YOU. Age should be no barrier-nor should any minor physical handicap.

New Course Tells All

Profusely illustrated, our new course shows you in simple, easy to understand language and drawings how to make each repair on refrigerators. vacuum cleaners, washing four hines motors, etc. Explains and gives you a working knowledge of electricity welding nickel plating etc. Shows you how to build the power tools you need and how to solicit and keep business coming to you. Not a theory course but an honest to goodness course written by and used by repairmen the country over. Price of course is so low that the savings on your own household appliance repairs will quickly nav for it. Act now! Mail the handy coupon below today

---Read What Our Students Say About Course---

really believe your course the best investment a me-chanically minded man can make.-Claude E. Aden, Indiamapolis, 1nd

To those who think NING MUSIC IS H

strike these notes and ven're eleving the businning of the "Merry

Widow" Waltz, Look at the disgram. The first note of the music is "D." Following the dotted line to the keyboard you'll find "D" in the white key between the two black keys near the middle of the keyboard. Now read below how rod can learn to play any instrument quickly and easily.

Don't delay. Send now for our Hustrated Free Booklet and Print and Picture ' Sample which fully explain this remark-ble method. So decide which instrument you want to play and mail the coupon today U S School of Music 812 Brunswick Bidg, New York 10, N Y (Successful 48th Year)

Easy as A-B-C—this "Print and Picture" way!

 Perhaps you think learning music is a tedious grind. It isn't any longer! Long hours of practicing scales and monotonous exarcise are over

You have no excuse for not getting started toward musical good times now! For through an easy method you can now learn to play right at home-without a teacher-for less than 7c a day

Learn to Play by Playing

The lessons come to you by mail from the femous U S School of Music . . . complete instructions, clear diagrams, and all the

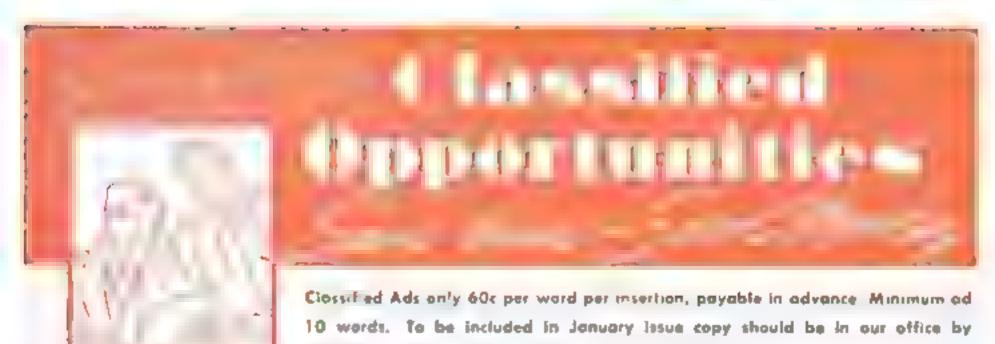

SUCCESSI

Hore a what one of pay thousands of pupils writes; i tearned mure from your quime than many of my friends who studied under private teachers have for years. The fact that I've alvoady taken 'courses and am new enrolling for a lift should speak for itself.' F. A. S. Indiens.

music you need You learn to play by playing real tunes by note First you are told how to do a thing Then a picture shows you how, Then you do it yourself and have it. Remember, don't confuse our method with any system claiming to teach music "by ear' or by trick methods. We teach you to play only from real notes!

File Morkshoppers

By HAL BORLAND

IN CHICAGO there is a steely-faced banker who would rather duck into his cellar on a sunny Saturday than shoot 19 holes of golf. In Hollywood there is a movie actor who prefers tinkering with old clocks to night-clubbing along the Strip. In Boston there is an auto mechanic who passes up the movies to sneak back to the shop and whittle bronze into chessmen. All over America, the breed of male who keeps the cellar light on half the night is increasing

Who are these artists who scorn the conventional pastimes, and why do they do it? To be blunt: Are workshoppers wacky? Most of their wives think so, and some of their

best friends are sure of it.

But what is a workshopper, anyway?

That's not so easy to answer-and maybe that is one way of replying to the charge of wackiness-for outwardly the man looks

normal. A little more contented, perhaps. Probably a little more competent in carving up the Christmas turkey. But what makes the workshopper different from his fellow clerks, vice-presidents, and machine operators is an appreciation of the well-made thingumajig, plus the ability to use his hands as well as his head.

Your workshopper likes to make things for himself. And he knows how: how to run a lathe or a band saw, how to read a micrometer or an oscilloscope, how to mix developer or paint. So he spends hours making

something he might buy for a fraction of its time-cost. But in his own shop he can afford to hire himself, and his product is as personal as a baby, bringing out the usual smugness

of paternity.

Who is he? He is the lawyer who relaxes from the courtroom by making inlaid wooden bowls on a lathe. He is the accountant who clears his mind of statistics by carving figurines from plastic. He is the writer who "wastea" a day making a fancy belt for his wife out of a worn-out pair of boots.

There are probably 10,000,000 of his kind here in America, men who have developed skills and ingenuities that add immeasurably to their lives. They aren't a new breed. Their American line goes clear back to Franklin and Whitney, and it comes down through Henry Ford, who mended clocks and dreamed of building an automobile; through the Wright brothers, who ran a bicycle shop

Hal Borland is no newcomer to the pages of POPULAR SCIENCE MONTHLY, A special writer for nearly 20 years, his articles, essays, poetry and fiction have covered many facets of American life. His latest book, "An American Year," was published last spring.

and dreamed of flying; through "Boss" Kettering, who worked with telephones and dreamed of building a self-starter for the automobile.

It is inevitable that in our specialized modern life we should turn from the job to something wholly different. The human mind needs more than one narrow track. That explains the dentist who is far prouder of his intricately carved tabletops than of his best dental inlays. It explains the doctor who would rather make a new fly rod than attend a medical convention. And that's why one famous musician is reluctant to make more than one concert tour a year—he begrudges the time he could otherwise spend in his workshop designing new tools for industry.

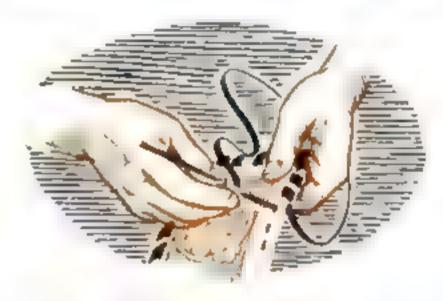

In his shop the workshopper is his own

boss. His time is his own, and so are his materials. When he has finished, the product is his; so are all the things he learned along the way, and so is the deep pride of personal achievement.

Sometimes the workshopper develops his manual skills on a doctor's orders. Handwork has a healing effect on those under severe mental strain. A well-known German editor came here as a political refugee and in a sanitarium learned to use his hands at a lathe. Physically recovered, he resumed his writing, but his hand-turned bowls and trays are now better known than his books. He would

never have done that abroad; it would have been beneath his dignity, and neither tools nor materials would have been readily avail-

able. Here in America, any man can equip his own shop with excellent power tools for relatively little money. And there is respect here for any job well done.

America has always had room for the man who could make things. The pioneers made their own furniture and most of their own tools, of necessity, and those who proved most adept at it soon had a respected craft. Out of their skills and imagination came still other crafts, and as demand increased they invented new tools, new methods. From water power they turned to steam, and eventually to electricity. Today the workshop of even the most casual home craftsman has tools that would have been unbelievable to Eli Whitney.

The workshopper of today has electricity for power—clean, compact, and quiet. If he works in wood he probably has a lathe, a drill press, a sander, and a power saw. If metal is his medium he probably has a precision lathe, a drill press, a router, and dozens of special attachments. If he works in radio or electronics, he has gauges and meters, vacuum tubes and condensers. Even such a simple tool as his electric soldering iron would have been a marvel anywhere 50 years ago. If he is a photographer, he has a

whole cabinetful of chemicals, hot and cold running water, any kind of light he wishes, his own enlarger, and a wide choice of print-

ing papers.

Even specialized knowledge is his for the taking. Fundamentals are available in school textbooks, and beyond these are bookstores, libraries and magazines, popular and technical, for background information or current developments. And for broader schooling in any field, there are night schools and correspondence and extension courses. The workshopper today has a base of known fact from which to work, and whatever he can add to it is new knowledge, his own contribution.

The Inner Glow

There lies one of the deepest urges of the serious workshopper: He can contribute True, nine out of every ten of those working in a basement shop are working for their own satisfaction. Their time is not wasted, however, for inner satisfaction, the glow of accomplishment, is important to any person. And the tenth one is, in effect, a lone researcher seeking new truth. Sometimes he finds it.

Edison started as a workshopper. Go over the inventions of the past half-century and you will find dozens of such men, who worked alone in their spare-time shops or laboratories—questioning, seeking, eventually finding.

No, most of those in today's home workshops are not inventors. They are craftsmen.

I remember the executive whom I found at home one Sunday morning making a pair of plastic link pins for his small daughter's wrist watch. He might have bought those pins at a jeweler's, any day but Sunday. But his daughter wanted to wear the watch that day, and she was firmly convinced that her father could make anything. So he made those pins, turned and polished and fitted them. On a time-cost basis they probably represented close to \$50, for he is a high-salaried executive. I suspect that he actually got at least \$100 worth of satisfaction out of the job-not to mention the fact that he further enhanced

POPULARIO

COVER: This painting by Ray Pioch illustrates the dream of many a top-flight workshopper —a real single-cylinder, double-acting steam engine, plans for which will appear in PSM.

his reputation as a capable, versatile father.

The workshopper has any number of reasons to offer for his part-time preoccupation. There is a surgeon who keeps both mind and fingers supple by doing miniature woodcarvings, mostly of animals. There is a physicist who carves costume jewelry out of nuts. He says it satisfies his artistic sense. And there is the architect who makes scale-model trains because, as he says, it keeps his mind aware of the detail necessary in his daily job. All these men, of course, get the mental stimulus of handcraft and the relaxation of concentrating on something wholly different from their daily jobs.

You will sometimes find a man who holes up in his workshop to get away from a nagging wife or demanding children. At least, he is doing something constructive, and he is probably wiser than the man who goes down to the tavern to get away from it all.

A Collector at Heart

Occasionally, too, you strike the magpie type of workshopper who accumulates tools and materials and spends most of his spare time listing them and keeping them free from rust. Even he is no worse at heart, I suspect, than the stamp collector.

But for the most part the man in the work shop is a good average citizen who knows, or wants to learn, what makes things tick. When he buys an automobile, he wants to know about its bearings and its ignition as well as its paint and upholstery. When he buys or builds a house he checks on its foundation

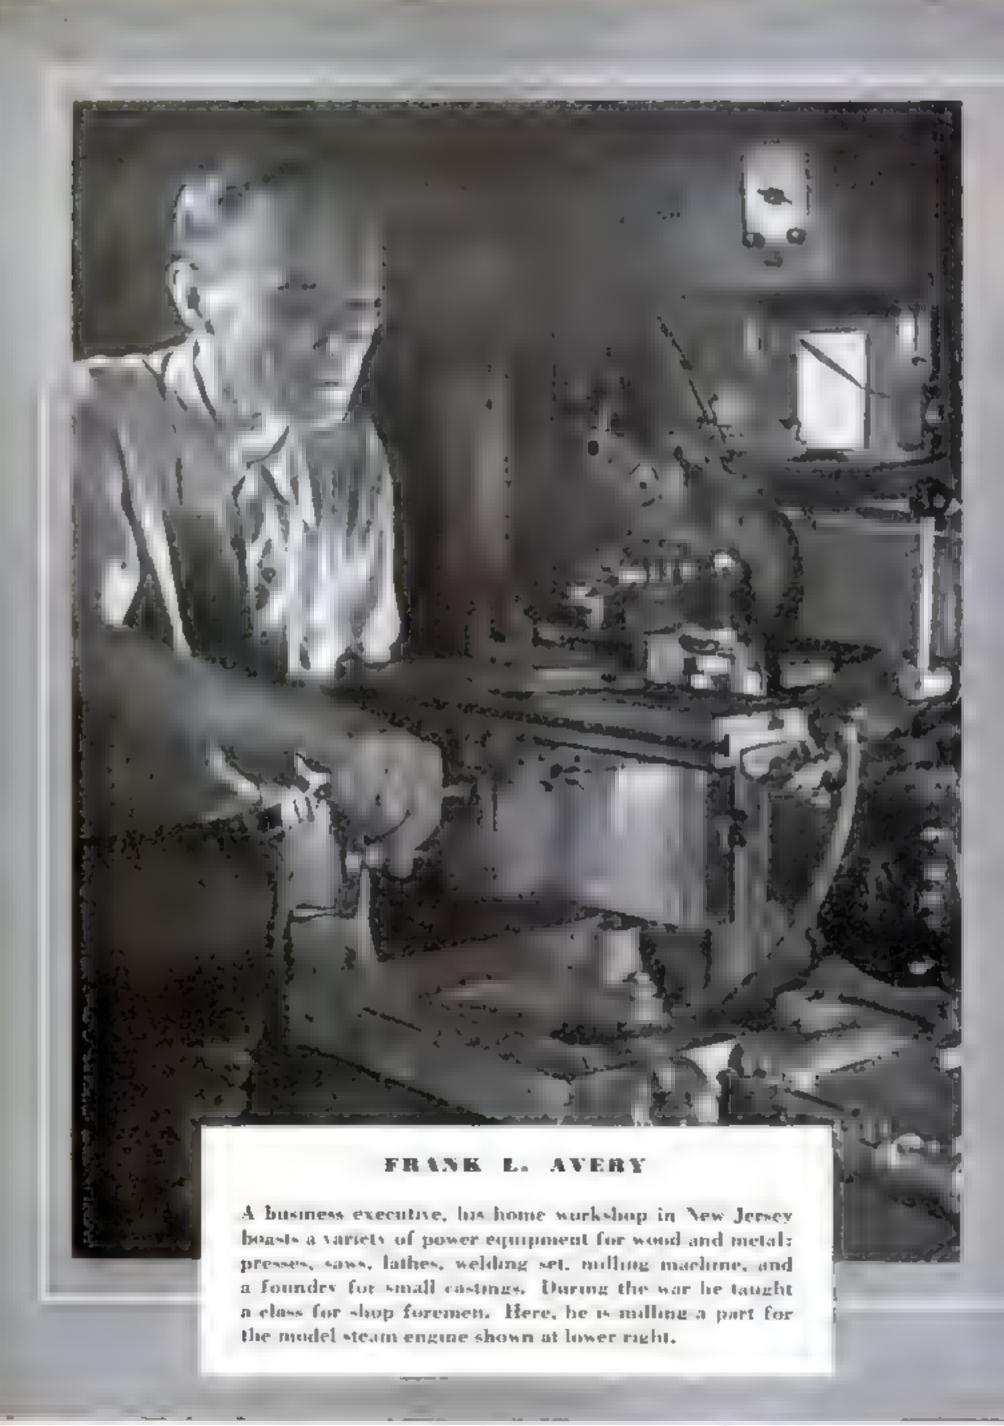

and its piping as well as the view from the picture win-

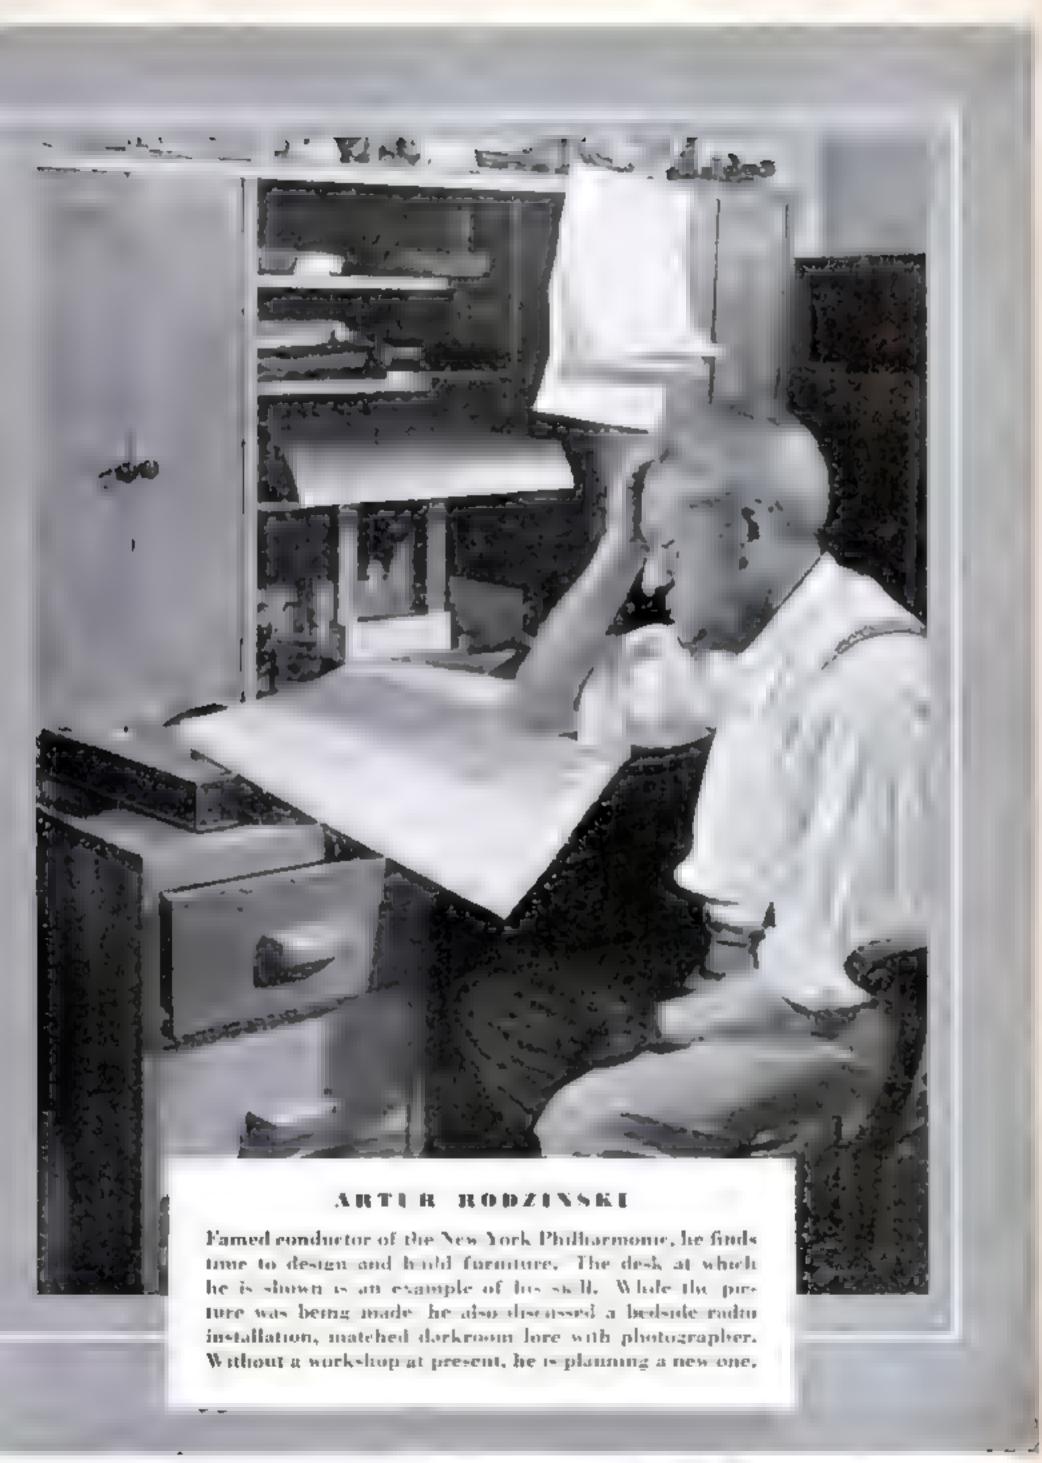

dow.

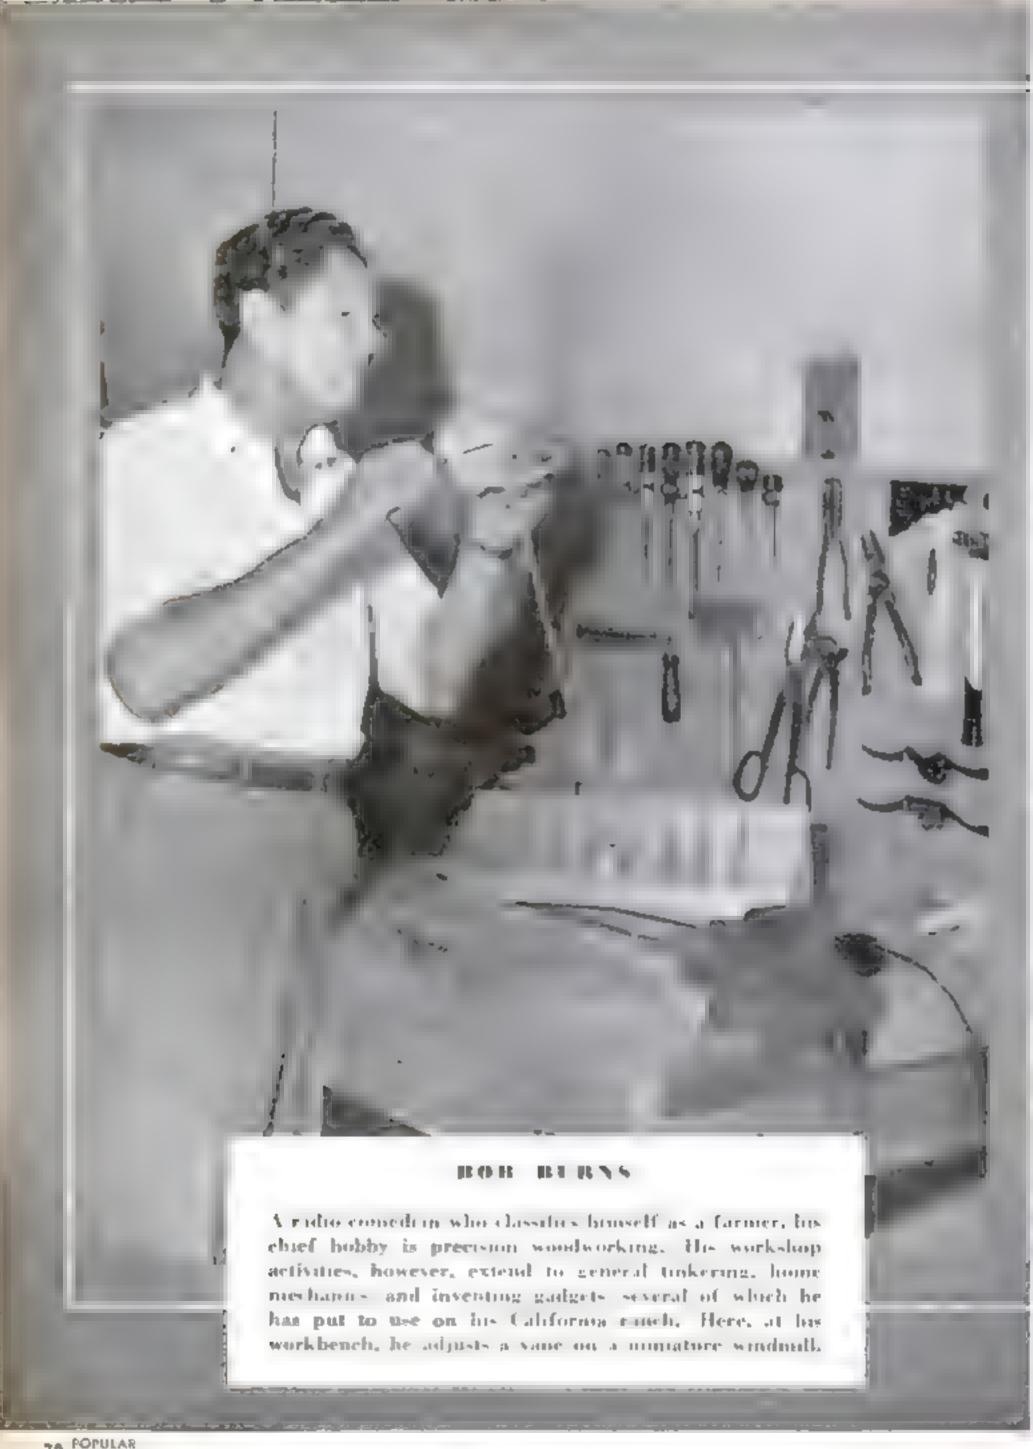

Why does he cling to that workshop? Because it is his own kingdom. It is the place where he can prove to himself that his own industry and ingenuity have their value. He can adventure there as he will. He can make a shelf to hold his wife's kitchen spices, or he can build a canoe with which to explore the near-by river, or he can build a telescope with which to reach out to remote galaxies. He can undertake anything his imagination or ambition suggests, and his success or failure in that undertaking is wholly dependent upon his own resources.

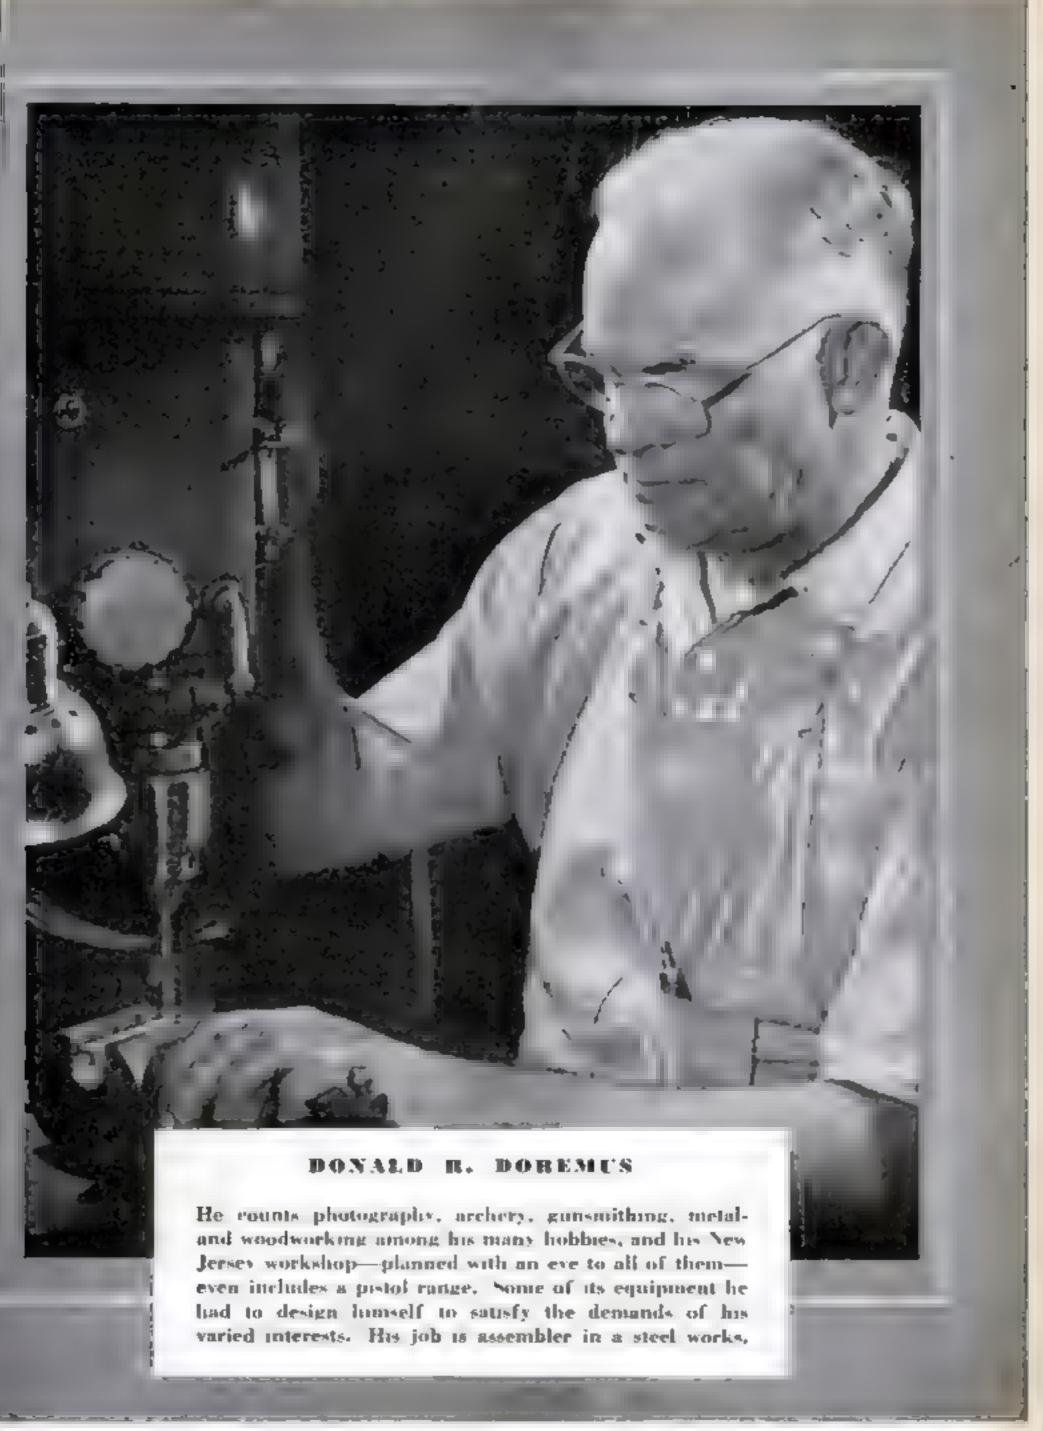

An ALBUM of American Workshoppers HENRY R. DIAMOND

An artist by profession, his hobby is woodworking and furniture design. His Long Island home contains many products of the cellar workshop where he combines artistry and craftsmanshop to create furnishings and fixtures that range from a beamed living-room eading to a studio couch with built-in space for storage and books.

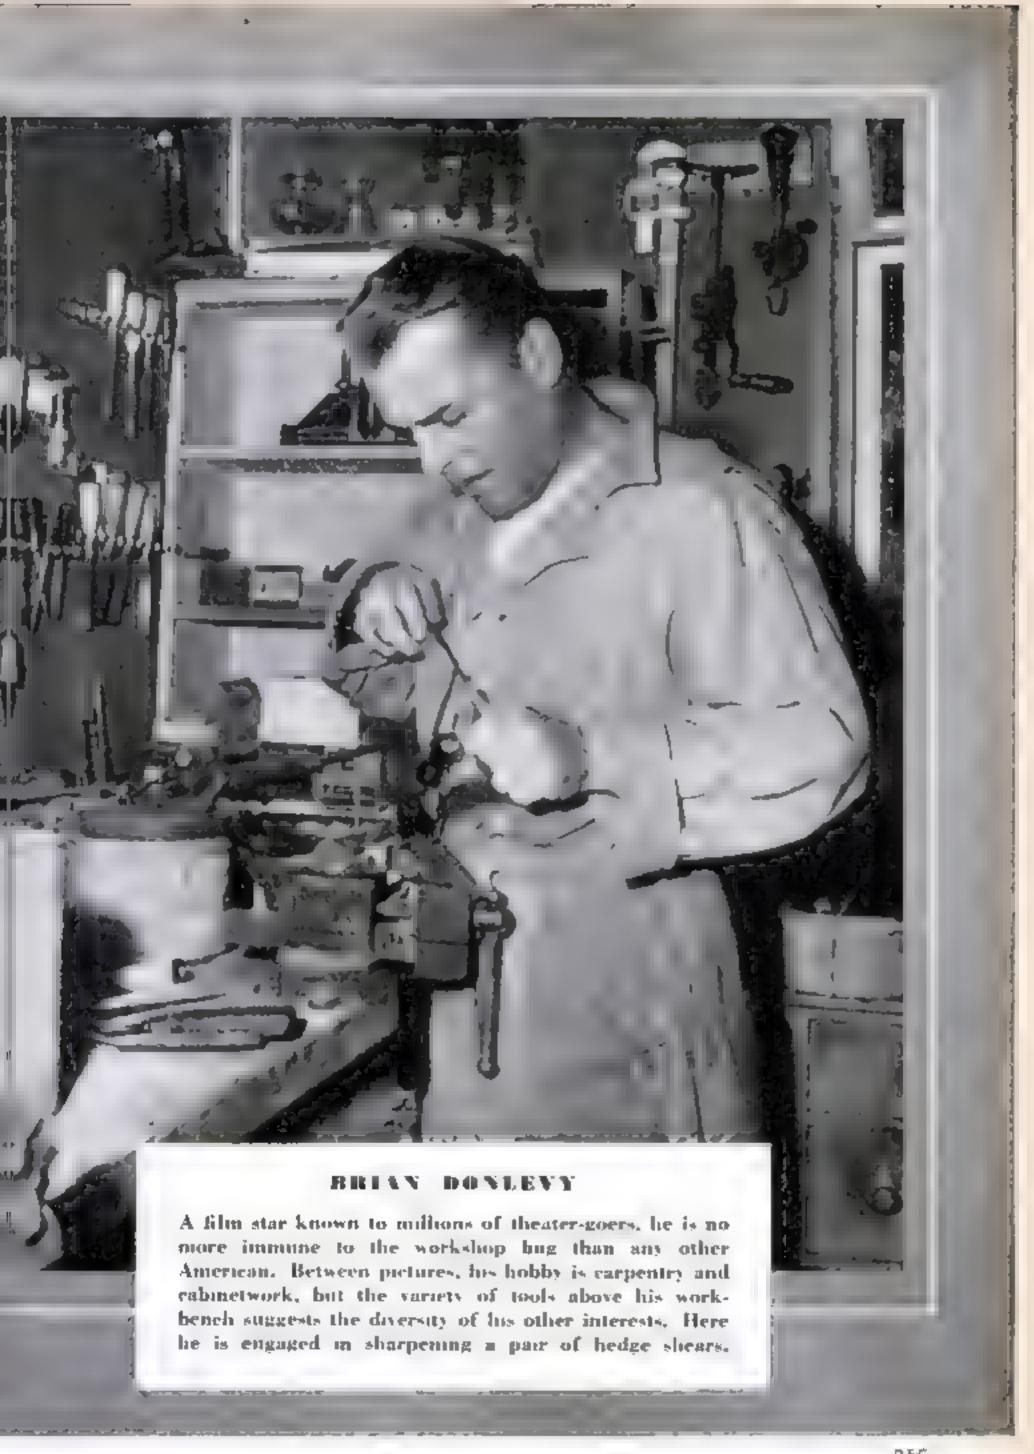

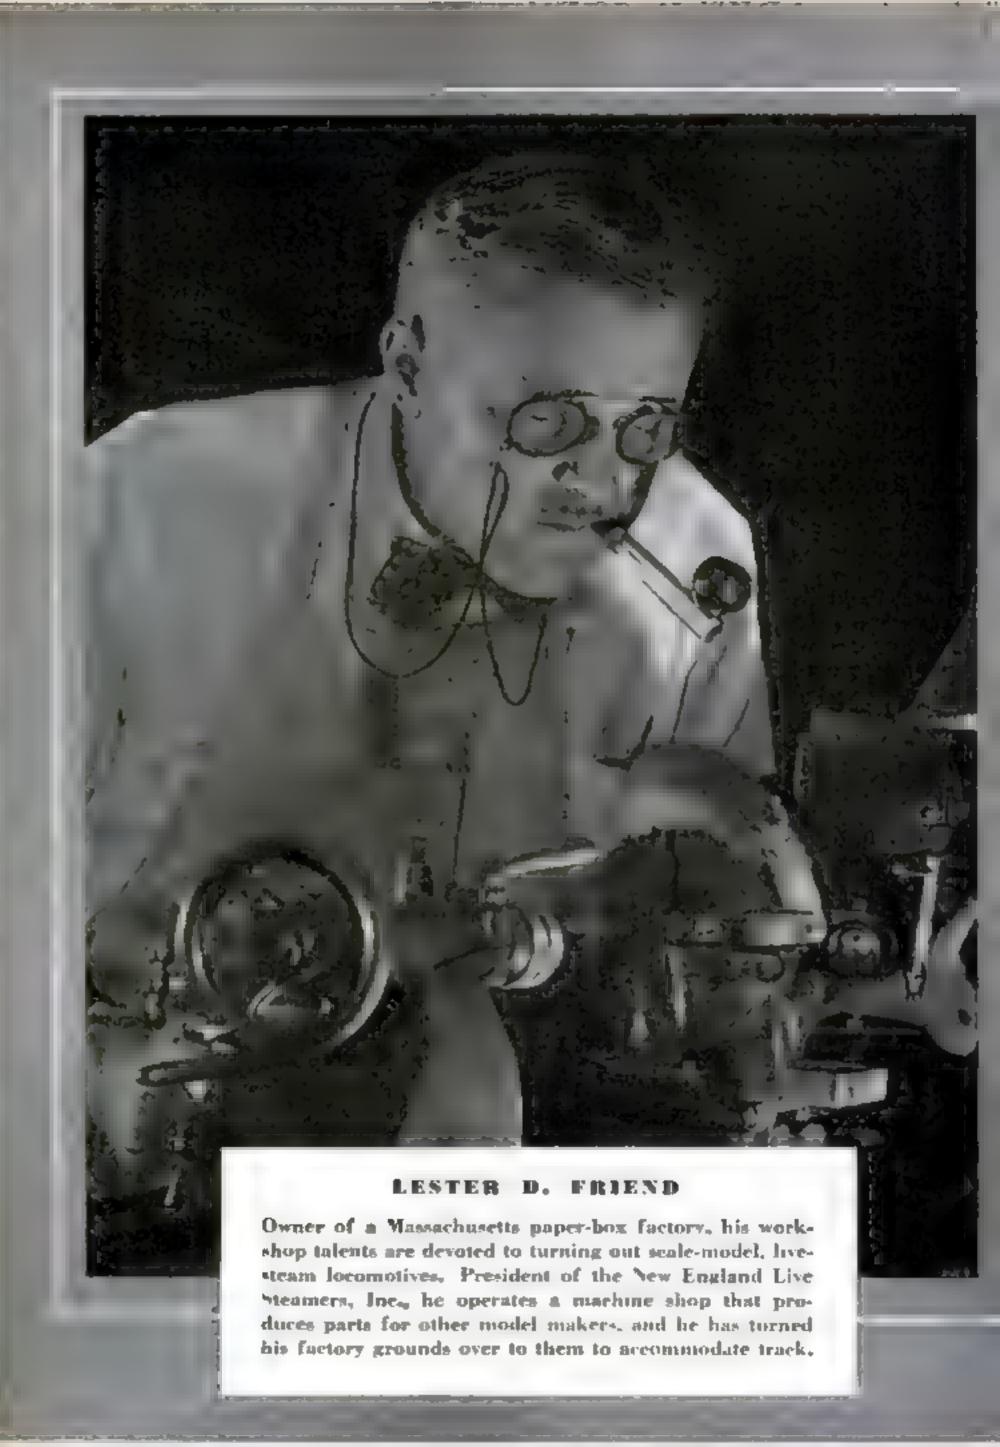

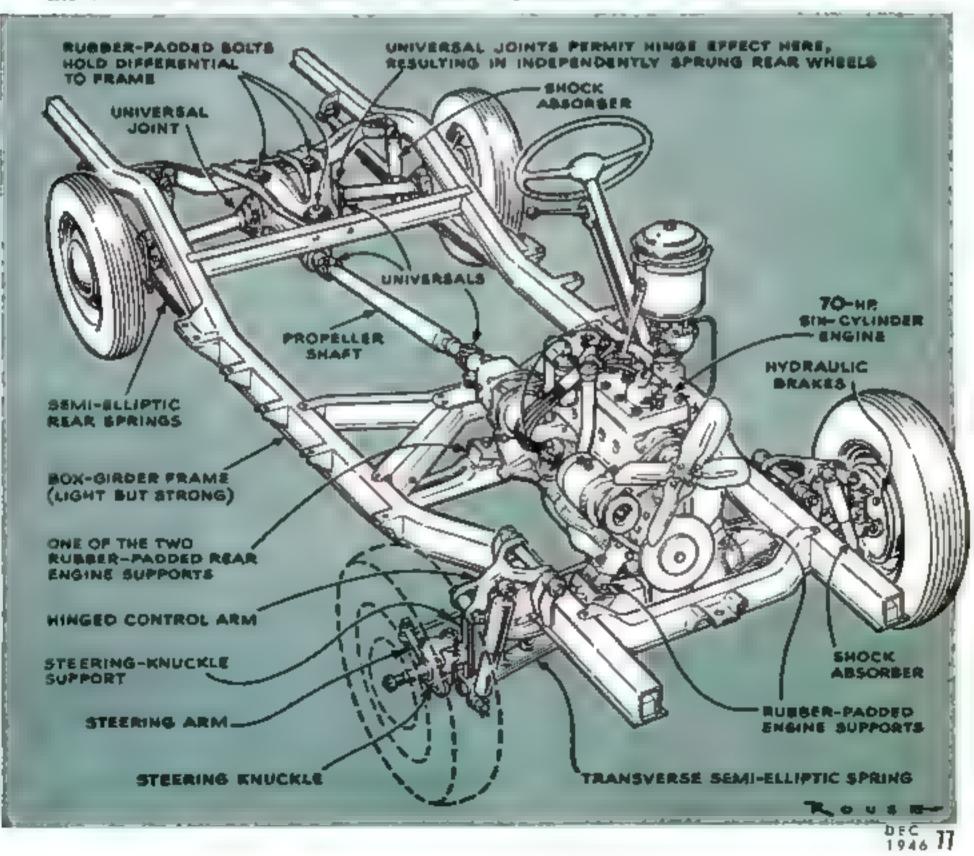

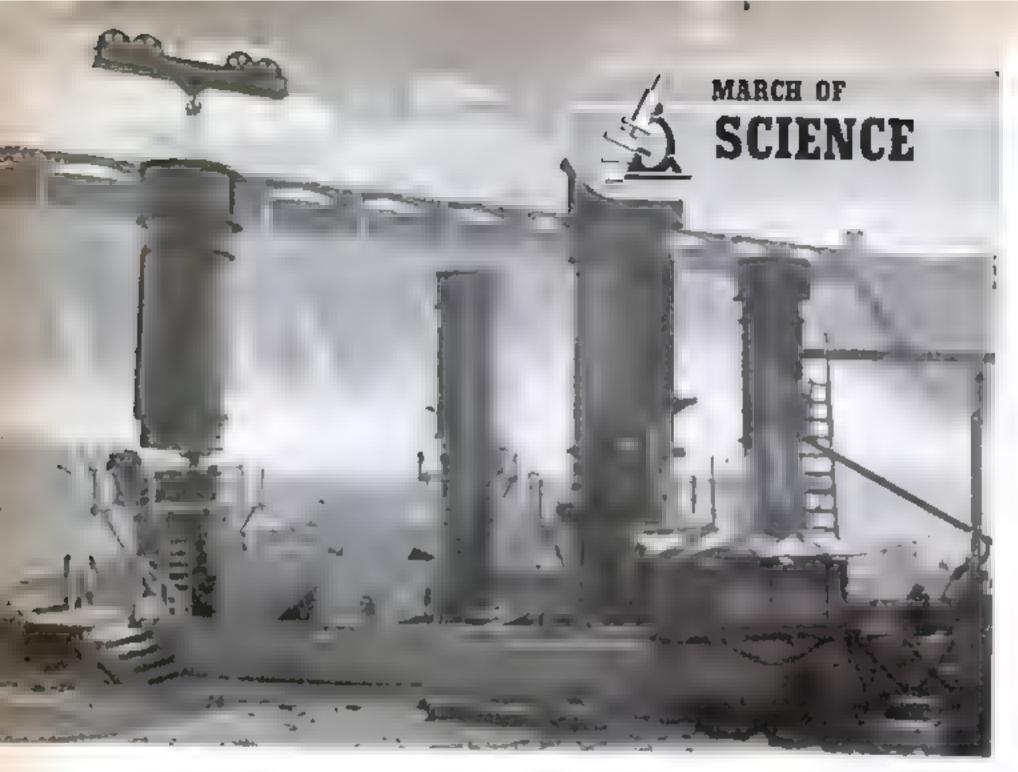

DESCRIBED as the first American stock car with independent suspension of all four wheels, the Willys-Overland 6-70 is a new entry in the lightweight division for 1947. A sedan seating three in front and two in the rear with room to spare, it has a wheelbase of 104 inches and weighs about 2,500 pounds.

Individual suspension of the rear wheels is achieved by using universal joints where the axles enter the differential. In front,

the traditional axle is replaced by a transverse spring connected to steering-gear assemblies. Rubber inserts in the spring make lubrication unnecessary

As its name implies, the car has a six-cylinder, 70-horsepower engine, designed to give 31 miles to the gallon at 30 m.p.h. and a top speed of 78 m p h. Because Willys is maintaining priority for its utility Jeep line, the new model will not be put into production until mid-1947.

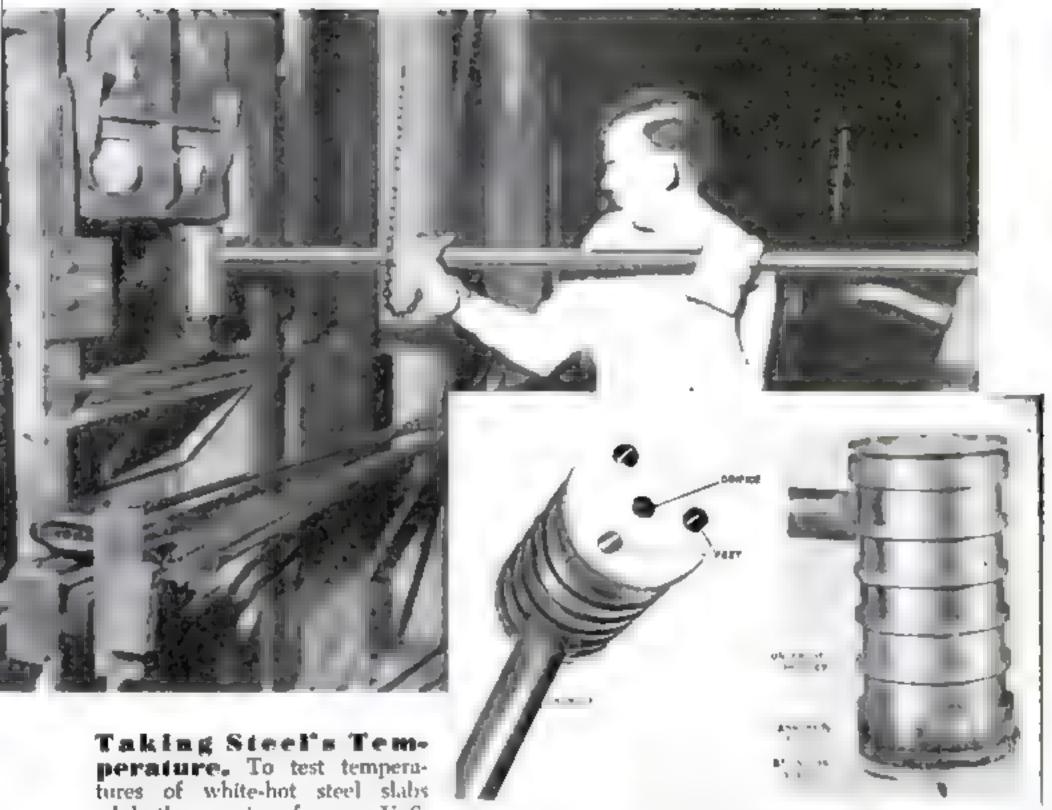

access tubes 7% feet in dram ter are shown above being tited to a huge caisson at Grand Coulee Dam, Wash. The caisson, to be floated to the dam when ready, will permit workers to repair a damaged spillway bucket. Air, materials, and service lines will be fed to an underwater working chamber through the tubes, one of which contains an elevator. A rubber seal keeps water out

Camera Prints Its Own.

Entirely automatic, the supercamera at right takes a picture, develops it, and throws it on a screen in 15 seconds. Designed secretly during the war by Eastman Kodak Co., it takes photos at a 1/10,000-second speed on special 16-mm. film. A container squirts chemicals heated to 140° F. on the film and a vacuum processes the picture in 9 seconds. It is then ready for the projector.

SURFACE PYRONETER BOTTOM AND THDE VIEW

Taking Steel's Temperature. To test temperatures of white-hot steel slabs while they are in a furnace, U.S. Steel has devised a new, long-handled, heat recorder. The water-cooled head (inset) is rested on a slab and picks up heat radiations through an eye in its bottom. Wires through handle transmit reading to recording potentiometer. Surface temperatures to 2,400 degrees F. can be measured.

X-Ray Detective. By giving a small electronic photomultiplier tube a fluorescent vest and a black paper coat, Westinghouse has developed an X-ray counter (right) that covers a wide intensity range. The black coat blocks out room light but lets X-rays reach the fluorescent screen. The tube then measures the intensity of fluorescence and records changes as rapidly as 1/1,-000,000-second.

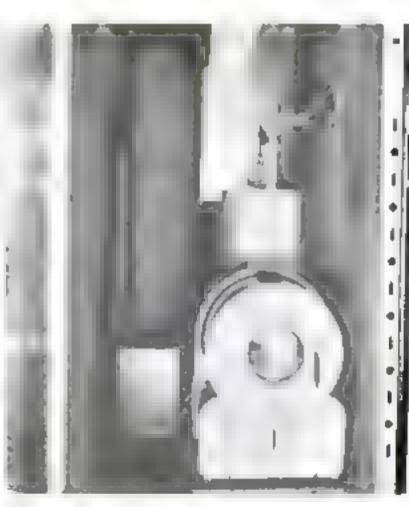

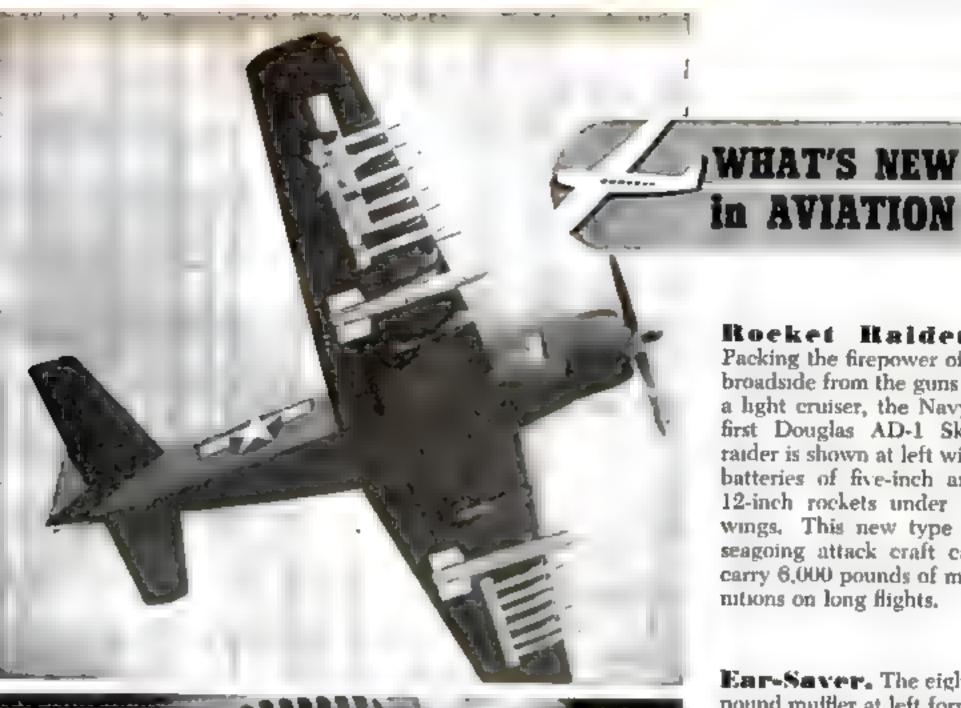

A new and unusually light prefabricated unit to combat the housing shortage is the "Boulevard Aluminum Home" shown above. Made by the Butler Manufacturing Company, of Galesburg, Ill., the two-bedroom structure is 24 by 33 feet. Wall panels are aluminum but the house contains 2,300 pounds of steel, most of it in rafters for the roof. The modern kitchen at left is part of the package.

Workers assemble the aluminum panels, which will not warp, burn, rot, ar rust. The house can be set up in about two-and-a-half weeks.

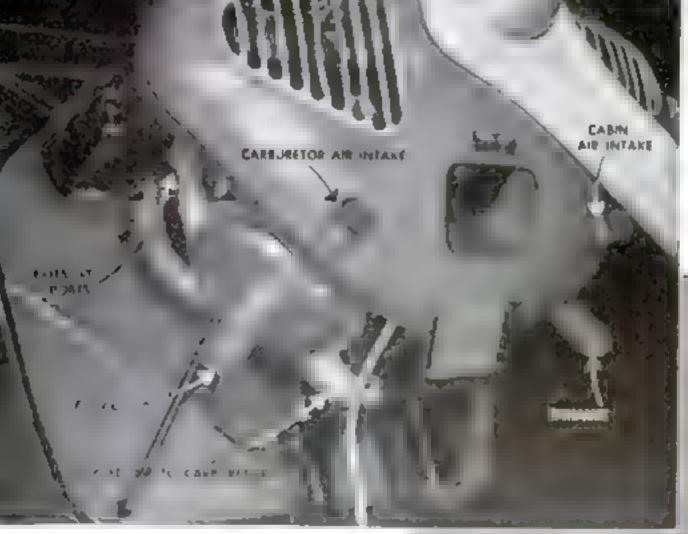

Washing machine, furnace, and hot-water heater are shaehorned into the utility room. If house has basement, the room becomes a stair well.

Rocket Halder.

Packing the firepower of a broadside from the guns of a light cruiser, the Navy's first Douglas AD-1 Skyraider is shown at left with batteries of five-inch and 12-inch rockets under its wings. This new type of seagoing attack craft can carry 6,000 pounds of munitions on long flights.

Ear-Saver. The eightpound multler at left forms a complete exhaust system and swallows 90 percent of aircraft engine noises. Developed by Ryan Aeronautical Co., it is designed for planes powered by 65-85 hp. engines. The system heats carburetor air and also directs warm air into the gireraft's cabin.

Sway-Back Prop.

Swept-back blades (right) leature Curtiss-Wright's new propeller, designed for use on future Army planes that may rival turbo-jets in efficiency at speeds up to 700 m.p.h., with much greater efficiency at lower speeds.

Fog is also being routed by light. Workmen above raise one of 38 towers carrying approach lights at Arcata. The 75-foot tripod standards are arranged in two rows of 19 each along a 3,500-foot approach

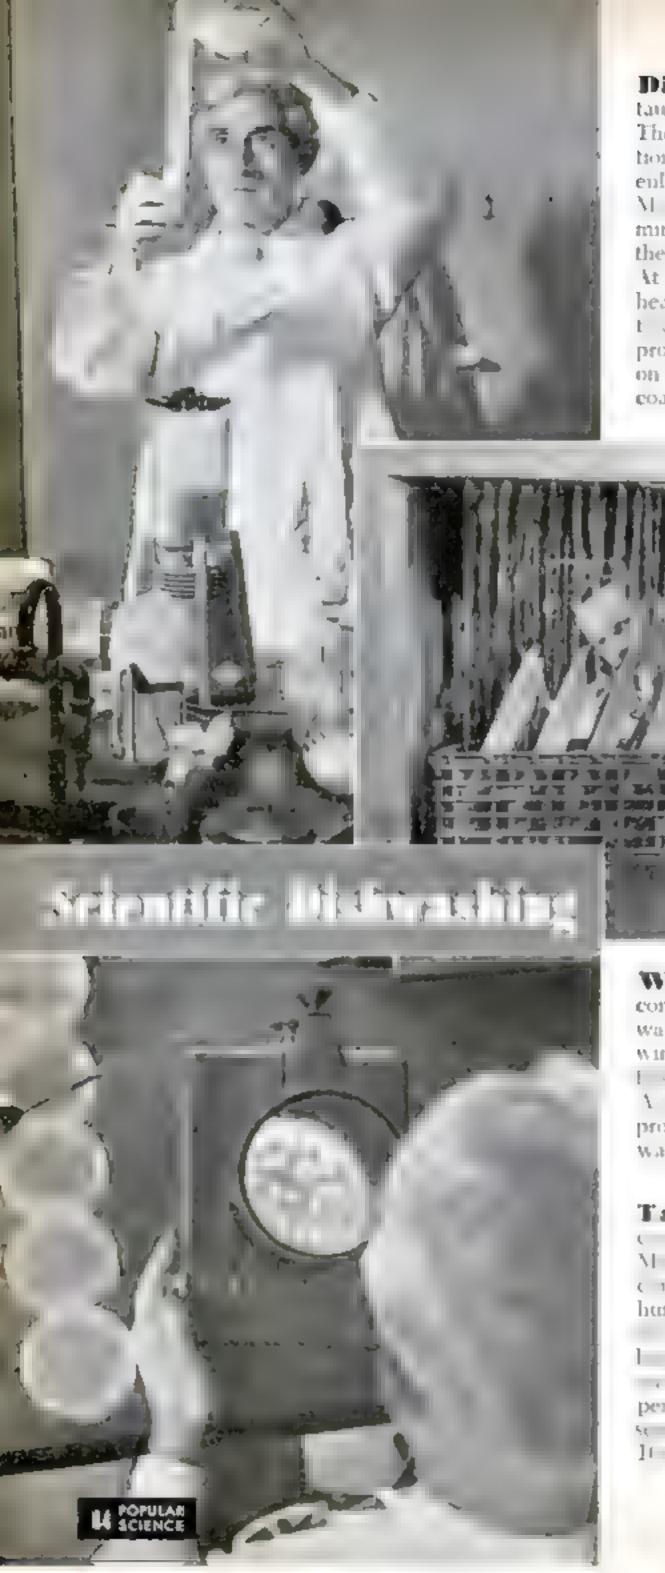

zone. They give the Naval station the most brilliant airport lighting in the U.S. Above, right, is a 5,000-watt American Gas Accumulator Co. light, one of which is atop each of the towers.

Improved weapons enter the battle against airport fog.

FLAME, sound, and electric lights have all been drafted in the latest skirmish of the endless fight against the amplane's arch foe—fog. At Arcata, Calif., where the Navy has its Landing Aids Experiment Station, the Navy, Army, and United Air Lines are constantly improving on FIDO, the vaporization of fog by heat. FIDO (Fog Investigation and Dispersal Operations) was

initiated by the British during the war.

Even as they explore the possibilities of fire, light and sound, Government and commercial forces seek other new anti-fog weapons. Experimental curtains of wind and 100-foot screens of water are to be thrown up alongside runways. Drying agents will be tested. The battle will go on until our airports win freedom from fog.

Dishing Up "Diet." Is restautant dishwashing dangerous? The National Samiation Foundation was worsed about it and enlisted the scientific resources of M. hr., State College to determine just how great a threat these methods are to public health At left, Dr. W. L. Maliman, public health professor, prepares an artical concetton containing food products similar to those found on dirty dishes. It was used to coat china for the tests.

Watching the Wash. Or conventional way in which cafes wash dishes is to place them in wire racks where they are then the with a with sprays of water. A paul De Koning, associate professor at Michigan State, watches a machine do its stuil.

Tattletail Germs. By Control of the Columbia Delta

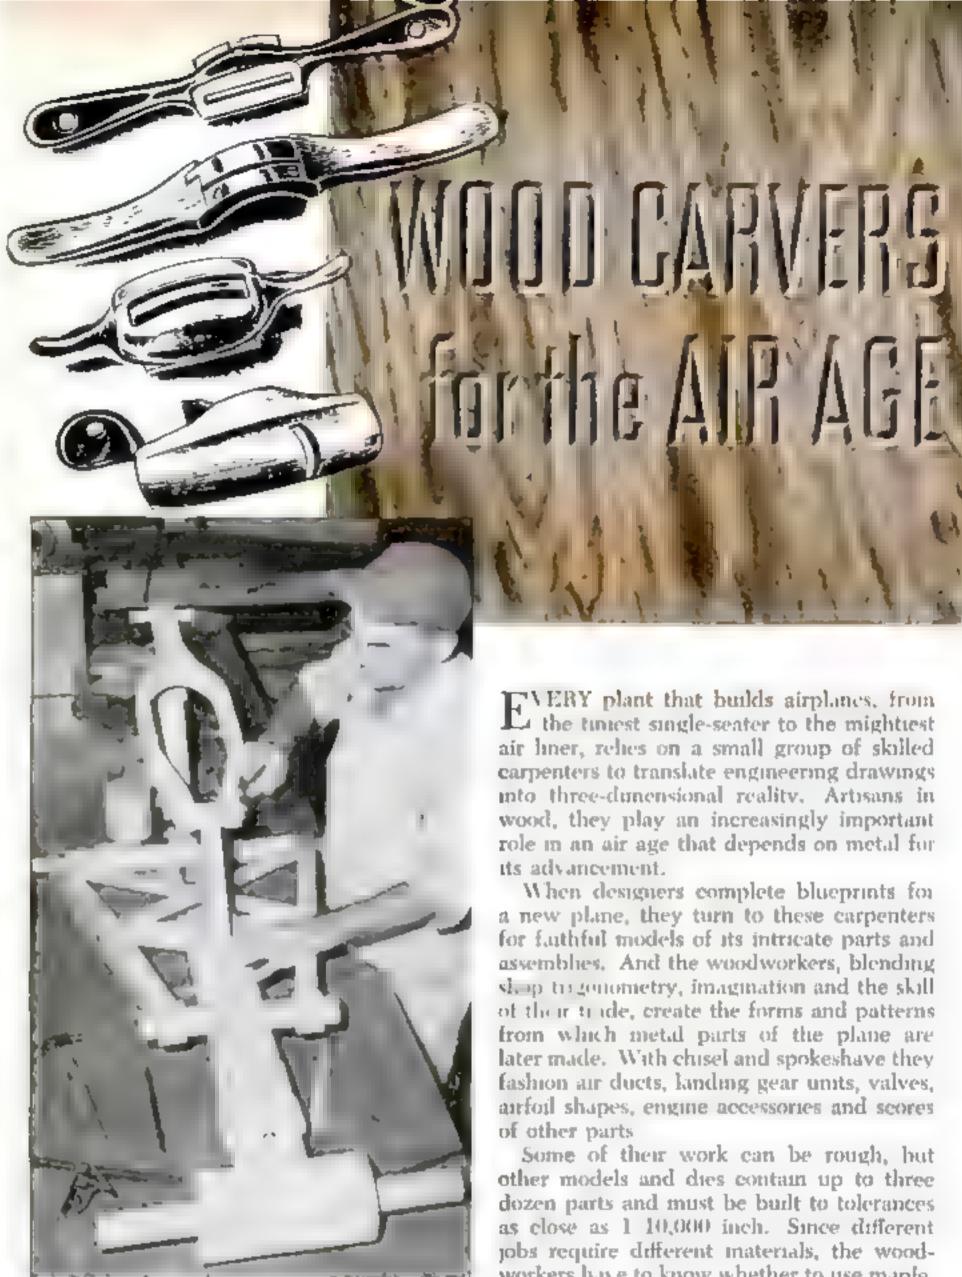

with 11 masks, the rolling oxygen tank above can reduce fatigue for an entire football team during time-out periods. It was used by Georgetown University during this past season. Tried on backs after long runs, the oxygen was found to restore normal breathing in 30 seconds.

Sidehili Gouger. That mythical animal comes to mechanical life in a new tractor built by L. C. Burton, of Akron. Its wheels automatically adjust to grades as steep as a drop of two feet in three. To do this, two differentials are housed one within another; the first to drive the rear wheels, the second to level the tractor.

Funciage Fueler. The shortage of building materials didn't faze Byron Chedester and J. E. Franks, of Fort Worth, Tex., when they wanted to go into the gasoline service station business. They simply bought the body of a Conestoga plane—engine and instruments removed—and opened up. The plane cost the pair \$500; the moving, \$100.

Thirty-five pine and phywood parts, with talerances of 1/10,000 inch, went into this model of a nosewheel strut for a secret plane. The woodworker is Fred Malle, Northrop veteran. At top of page are four of an aviation corponter's most important tools. From top to bottom, they are: straight-edge and rounded-edge spokeshaves, patters-maker's spokeshave and round-bottom plane. Lost two are used for roughing out work, first two for finishing it.

EVERY plant that builds sirplanes, from Le the timest single-seater to the mightiest air liner, relies on a small group of skilled carpenters to translate engineering drawings into three-dimensional reality. Artisans in wood, they play an increasingly important role in an air age that depends on metal for its advancement.

When designers complete blueprints for a new plane, they turn to these carpenters for futhful models of its intricate parts and assemblies. And the woodworkers, blending shop to gonometry, imagination and the skill of their tride, create the forms and patterns from which metal parts of the plane are later made. With chisel and spokeshave they fashion air ducts, landing gear units, valves, airfuil shapes, engine accessories and scores of other parts

Some of their work can be rough, but other models and dies contain up to three dozen parts and must be built to tolerances as close as 1 10,000 inch. Since different jobs require different materials, the woodworkers have to know whether to use maple. pine, birch, walnut, mahogany or the versatile plywood, or combinations of them, for a specific task.

Most of the woodworkers are young men, able to adapt their skill to the rapidly advancing art of plane design. The pictures on this and the following three pages show how well that skill is applied.

Running a band saw along lines photographed on an emulsified panel of plywood, Harvey Boston, of Douglas, shapes a latting section, used in establishing a plane's contours. Plywood is sealed and painted before the emulsion is applied.

Pattern-maker's spoon, a development of the corving chisel, is used by Sid Gladwell in cutting out a line on the mahagany pattern of a carburetor intake duct designed for the Lockheed Saturn.

Ted Weimer, of Douglas, fairing a skeletoned check jig to its mold lines with a straight-edge glass spline to eliminate any bumps or hollows. The finished part carries air to a carburetor.

Glodwell checks a mohogony model of large air duct with metal temptate to insure accuracy. Mahogany holds its shape well, with little shrinkage, and is easier to work than pine despite its toughness.

DEC. 87

Wooden forming die and metal gate, tipped with aluminum, is used to form plastic wing tip of a small plane. The wood part is made of birch, which has largely replaced maple in aviation woodworking.

Art Russo, of Northrop, wields a fine-toothed rasp to smooth white-pine toil section of a droppable gas tank. The maple cone at right is a copy of the nose of an air-duct diffuser.

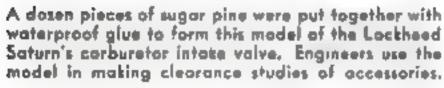

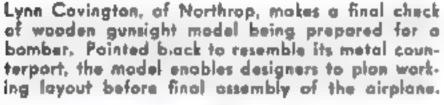

Newest lightweight plywood has mahagany surfaces and a plastic honeycomb core, called micarta. At left, a hand-guidelf electric router cuts channel through a panel of the material, which is used to form such models as the stairwell and bannister, below, of Lockheed's huge Constitution. The mahagany surface of the new plywood provides an extremely smooth finish that takes lacquer well,

88 SCIENCE

Using a 1/2-inch bent-shank carving chisel, Northrop's Stanley Ton smooths plywood bracket on a reproduction of oxygen pressure regulator. Other parts of the complex assembly are made of white pine.

Covington fits precision-made wood assemblies into a prototype airplane's radio compartment. By thus simplifying details of arrangement, the aviation woodworkers' creations save time, money and effort—and assure greater efficiency in new planes.

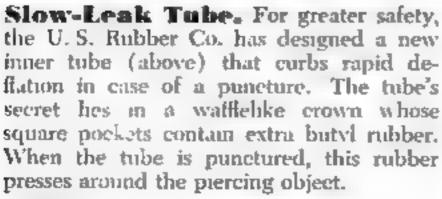

DEC. 89

Roadless Road Test. To test new gasolines, Gulf Oil Corp. has installed a "highway" in its Harmarville, Pa., laboratory. The front wheels of the car are chocked on a road-test dynamometer. The rear wheels rotate a heavy dram retarded by machinery to simulate the effects of ear-loading and road conditions. Uphill pulls are created by braking the drum; down grades, by cutting in an electric motor that helps rotate it. A fan blows wind at the car at its assumed speed. The "driver" calls off mileage. Man in back seat records findings. Elimination of variable factors found in real road tests increases accuracy.

Air-Bubble Tire. Lighter and tougher is the new air-bubble tire produced by the U. S. Rubber Co. Designed for 14 percent more air volume and eight percent lower pressure, its flatter tread and sharply defined shoulders use less rubber—sharply cutting road heating. A section of the new easing is shown at right above; at left, the old.

90 SCIENCE

At 5 51 a.m., local time, on October 4 the Boeing Superfortress "Pacusan Dreamboat," under command of Col. Clarence S. (Bill) Irvine of the Army Air Forces, took off from the island of Oahu, Hawaii, for a flight over the top of the world. Less than 40 hours and 9,422 statute miles later it touched down at Cairo, Egypt.

The Dreamboat had proped that routing tomorrow's air traffic across the Arctic-using the shortest distances between most points on the habitable parts of the globe—was practicable. Nor was the flight without military significance "He who rules Alaska," said the Air Corps' immortal Billy Mitchell, "rules the

world."

Here is the inside story of the Dreamboat's flight as told to Popular Science Monthly's Devon Francis by five members of its 10-man crew.

Col. Clarence S. Irvine, of St. Paul, Nebr., pilot: We knew our approximate take-off time. It had to be between 5:30 and 6:30 in the morning. That was because we had to leave the ground with the prevailing wind instead of

upwind, and the lowest velocities occurred at that time of day. If we took off upwind, we would pass right over the city of Honolulu,

PSM FEATURE

with mountains in front of us. We couldn't take that chance, heavily loaded as we were.

Richard B. Snodgrass, of Seattle, a civilian and chief engineer: The weight of the airplane at the start of the flight was approximately 148,500 pounds. That's about five tons more than the Superfortresses grossed during

the war when they took off to bomb Japan.

Colonel Irvine! But we weren't wormed. We had planned this flight for too long a time, and we knew exactly what we were to do in any contingency. By building a piece of runway 100 feet long, we had linked up the Navy's John Rodgers Field and the Army's adjoining Hickam Field. That gave us about 13,000 feet in which to get off the ground. I had posted markers along the runway at each 2,000-foot mark up to 12,000 feet to judge distance at high speed. The markers were check points. We had to be sure of where we would get airborne.

Warren, of Plainview, Tex., and Omaha, Nebr., co-pilot: Our minimum calculation at the start was that we would be airborne at 5,600 feet. That took into account the weight of the air-

plane, the rolling friction on the asphalt runway, and the drag against our thrust horsepower available. We figured we could do that if we held the brakes, ran the engines up to full power, and then released the brakes.

But when we tried it in practice flights the propeller torque threw us off directionally just as we started rolling. It was impossible to get the airplane pointed down the runway again without using brakes. That cost us speed. So we decided to start right out from zero and use the throttles to maintain direction. We figured that would cost us another 1,000 feet of runway. We added 1,000 feet to that for the human element, and arrived at the conclusion that we would be off the ground in 7,500 feet.

Colonel Irvine: We knew that we could lose an engine on take-off at the 6,000-foot mark on the runway at an indicated airspeed of 145 m.p.h. and still get airborne on three engines at what we estimated would be 155 m.p.h. If we lost an engine on take-off the procedure called for gaining some altitude, dumping gasoline from tanks in the bomb bay, burning more gasoline for an hour, and coming back to land approximately 25,000 pounds lighter than we were at take-off.

If we lost an engine under the 6,000-foot mark, we could come to a stop before reaching the end of the runway, and without using the brakes, by reversing the pitch of the propellers. I had reversible propellers

installed for just that reason.

Colonel Warren: We sat there at the end of the runway with the engines ticking over. I had run them up, and we were squared away for the take-off, facing the length of runway No. 26. I turned around and said to the crew, "Here we go!" Then I opened the throttles.

We had a four-mile wind on our tail. The flaps were down 25 degrees, which is normal. The airplane felt good as we gained speed. We had the trim set exactly where it should be for fore-and-aft balance. That, I must say, was accidental. It's hard to figure trim. It

was a very short time until we had full power on. That was 2,800 revolutions on the engines with 52% inches of manifold pressure.

It was at about 2,000 feet of our run, maybe 2,500, that the least back pressure on the control wheel brought the nose wheel up just enough to clear the runway. I just held it there until the airplane flew itself off. It came off smoothly and cleanly. I don't think anyone in the plane actually knew the instant when we left the ground. Our indicated airspeed was 148 m.p.h. We had consumed 6,500 feet of runway. The controls felt firm, not soft.

As we lifted off I turned to Colonel Irvine and said, "Bill, this is no different from a thousand other take-offs we've made together."

He replied, "If you ever had a take-off in your system, this was the time to do it."

We got the landing gear up and pulled up the flaps very slowly, meantime gradually reducing power. We were climbing gently as we rounded the southwest end of Oahu.

Maj. Norman P. Hays, of Seneca, Mo., navigator: We held the take-off heading for a few minutes as the airplane gained speed. The directional gyro was set. It was checked with the astrocompass. We used

dead reckoning from the point of departure to the point of first climb. Then radiocompass fixes were obtained.

Mr. Snodgrass: We pulled 1,450 horsepower from each engine at the start of the flight, once we were leveled off. That was 72.5 percent of rated power.

Colonel Irvine: The flight was going just the way we had planned it. The planning had been the hard part. In attempting a flight over an area where our best information indicated that communications would be undependable and ground-radio aids scarce, and where rescue certainly would be slow in coming if we were forced down, the first requirement was insuring the utmost reliability in the operation of the airplane. This involved two things: first, a thorough training of the crew to get the most out of the plane and its equipment, and exercises in the use of emergency equipment for both water and ice landings; and, second, the en-

gineering preparation. We devoted three months to nothing but engineering calculations.

Mr. Snodgraus: We ran fuel flow-power calibration curves for the engines at 1,000, 5,000, 10,000, and 15,000 feet. Torque meters showed us exactly how much horse-power was being drawn from each engine. At a preset altitude we used a given power setting to get an indicated speed, and calibrated that for every altitude and power setting we expected to use. That, of course, had to be refined by calibrations for various weights. We tested the fuel-flow meters, the air-speed indicators, engine thermocouples, and everything else that would have to be calibrated in flight.

Major Hays: It looked as though navigation would be something of a problem. There were no charts available of the kind I wanted for polar navigation. In fact, there were few polar-navigation charts at all. So I got a stereographic (three-dimensional) map at a scale of 1:5,000,000. Then a grid was constructed and superimposed on the chart. Greenwich was used as grid North reference. The best available lines of magnetic variation were converted to grid variations and plotted on the chart.

We didn't take along any equipment like Loran. It was too heavy. For the same reason we didn't take any navigation tables. We did take an air almanae and a new addenda sheet for correction of low-altitude refraction. The most important item we took was the directional gyro—the magnetic compasses would be useless. Then, of course, we took two sextants for sun and star sights.

Colonel Irvine: We did a lot of things to the airplane. In addition to installing bomb-bay tanks, we replaced two center-section regulation tanks with nylon cells to save weight. We installed a special fuel system. We fixed up the oil reservoirs of the four engines so we could pump oil from a reserve supply in the fuselage to any one of them. But, more important, we could withdraw all the oil from any one engine if we wanted to and use it for the other engines. If an engine went bad, its oil wouldn't be wasted

We replaced the regular landing-gear retracting system, which brought up the wheels in 30 seconds, with one that brought them up in nine seconds. That was for added safety in take-off because half of the total

drag of a B-29 at speeds under 150 m.p.h. is in the landing gear.

We pumped up the tires to 110 pounds, about half again as much air as they normally carned, and let them stand for a week so they would get a permanent "set." Then we measured them and altered their wells to accommodate the stretch.

By reducing the cowl-flap openings we knew we could pick up a few miles an hour in speed. By repeated flights we discovered we could open the two upper flaps on the inboard engines no more than 1% inches and those same two on the outboards about an inch and still get sufficient cooling with all side flaps completely closed. The cooling on the inboards was more of a problem, quite naturally, due to fuselage interference with the air flow.

Lt. Col. Frank J. Shannon, Sr., of Philadelphia, communications officer: The Dreamboat was equipped with a low-frequency adapter to cut through ionospheric disturbances if they developed. I had talked with

"fringe" fliers who had been on the edge of the auroral radio disturbances, and they had told me that, in the Arctic, communications simply went out. All of our air-ground communication was to be in International Morse, of course.

We confidently counted on radio blackouts at from 60 to 70 degrees North. The "fringe" fliers said there would be no static; a receiver would just go ahead. The only thing we would hear would be the hiss of the thermal effect of the transformers, of the wiring and filament emission of the vacuum tubes. Low-frequency sending and receiving would cut through, but it would be practicable only at short range.

I was prepared for another phenomenon ionospheric "skip." That comes from the high-frequency signals hitting the gaseous envelope surrounding the earth and bouncing back beyond the station you're trying to contact.

But I figured we were covered for any kind of a contingency. I over-planned, in fact. Among many other things, I had asked that "hams" all over the country belonging to the American Radio Relay League cover my frequencies. They did—in volume. I got their reports when I got home.

Colonel Irvine: We had adequate safety devices if we were forced down. We took along the standard Air Forces emergency kit containing rations and medicines. To that we added a sea-landing kit, essentially the same one used on flights against the Japs, and an ice-cap kit-carbines, ammunition, a special gasoline cook stove, food for three weeks, three complete sets of sock-lined felt boots for each man, fur parkas and trousers, and gloves. We studied the procedure for survival in the Arctic.

If we were forced down at sea, we would have two seven-man life rafts. In addition, each man would have his own raft attached to his 'chute, his Mae West, fishing tackle, pyrotechnic signals, and equipment to make salt water drinkable. Our safety equipment weighed 120 pounds per man.

It was because we had prepared so carefully that we weren't surprised that everything seemed so routine once we were under

way.

Colonel Warren: When we had reached our maximum speed at original emising power we were indicating 233 m.p.h. That was good. We had figured it would be only 228. For the first five hours or so we held 1,000 feet of altitude. Then we hit a weather front and had to climb to between 5,000 and 6,000 feet. It was soupy there. We climbed slowly, using no additional power. That would have cost us slightly more fuel.

We held that altitude until we were 30 minutes off the coast of Alaska, at Sitka, Then, still not increasing power above that for cruising, we climbed to between 15,000 and 16,000 feet. It got dark just before we hit Sitka. Through a few breaks in the clouds we caught glimpses of lights below. We saw Juneau, too, by luck, but mostly we

had to fly in soup.

A weather-reconnaissance plane we talked to assured us we wouldn't pick up ice, but we did. It was rime ice. That's not the dangerous kind, and it did not become serious. We had no de-icing boots on the wing. They would have added weight and drag to the Dreamboat.

Colonel Shannon: Communication was perfect. We were equipped with frequencies of 11,445, 8,200 and 6,355 kilocycles, and we were not out of touch with the Airways Communication System (formerly Army ACS) at any time. We worked WZJ at Hickam Field until we got past Fairbanks. I knew we could

work stations at Seattle, Anchorage, and Fairbanks-or try to-but then came a long break of more than 2,000 miles between Fairbanks and Frobisher Bay, Baffin Island. I assumed we would have trouble there. We didn't.

From Frobisher Bay we had the facilities of a station on the west coast of Greenland known as Blute West 8, another on the southern tip of Greenland known as Bluie West 1, and others at Reykjavik, Iceland, and in Europe.

By the time we were breaking out of Alaska and entering the Yukon Territory I

was in touch with Bluie West 8.

Mr. Snodgrass: Meantime, we were keeping a constant check on the fuel. We used our lift-over-drag ratios and refined them with considerations of propeller efficiency and the most economical fuel consumption we could reach. The consumption at the start of the flight had been 436 gallons an hour. That dropped steadily.

Major Haye: We had to use dead reckoning when the airplane was between layers of clouds or in the soup. We had anticipated a nine-knot tail wind. The forecast winds were very accurate over the Arctic, and we checked them with celestial fixes when wa could. These winds held good until we approached Greenland. Then we hit head winds where tail winds were forecast.

Colonel Irvine: It was plenty cold. But we encountered the arctic temperature moderation at altitudes that I had anticipated. Our outside temperature at 20,000 never went lower than minus 36 degrees Centigrade. But that drives you to bundling up-and then you sit there and shiver. A B-29 isn't insulated.

Colonel Warren: We were in intermittent soup for about 1,000 miles inland. We picked up more rime ice. The amount of it never reached the danger point, though. Pretty soon the clouds began breaking up around us. We found ourselves over a low undercast. There were times when the undercast was broken and even scattered.

We could see mountains and lakes in the moonlight. It looked like pretty rugged country. You didn't want any part of it

Just before sunup we approached Baffin Island. On its westward side and in the interior it looked as though it had been shaved off by a glacier. There wasn't nearly as much snow as we had expected to see. There was plenty of snow, but we also could see bare patches of ground. As we passed the center of the island and got over the eastern part, the ground got torthous in contour. On the east coast there were numerous big rivers, deep and not frozen over. There were convoys of teebergs in them.

Colonel Irvine took a look and said, "Here's where we sit back and listen to the

sound of the engines."

We had some fun about then. I was sitting in the pilot's seat. We had noticed a few light spots on the horizon, and supposed they were due to the Northern Lights. We had watched the Northern Lights during the night. They weren't very brilliant, nor did they have any color in them. One light spot appeared about 20 degrees left of the nose of the airplane, now. It seemed to grow lighter. If that proved to be the sun, we would be off our course. The sun had to come up to the right of our nose.

I started kidding Norman Hays. Nobody was worned. He's an excellent navigator. Moreover, he had had chances to get celestial fixes. But he got somewhat concerned himself. It took a long time for the sun to appear. We couldn't see it yet but we could see its reflections on clouds. Finally it showed up—at five degrees to the right of the nose, where it was supposed to be. The first rays of dawn came on the wrong side of the airplane due to the rotation of the earth and the high latitude.

Colonel Irvine: Sunrise in the Arctic is the most spectacular thing I have ever seen. Just before the sun cleared the horizon it was suddenly shaded by a greenish cast. It must have been a prismatic effect of ice particles.

Colonel Warren: For about an hour after we hit the coast of Greenland we could see the ice cap. From altitude it looks like water. It has a characteristic wave formation. Here and there are cracks and crevasses, but on the whole it's flat and smooth except for the waves.

We passed a couple of hundred miles north of where the magnetic pole is plotted, and the compass needle still swung back and forth in a northerly direction. It swung the whole time we were in the Arctic, as much as 30 degrees off course.

Colonel Shannon: Over Iceland we picked up another weather-reconnaissance plane. I

asked him what his conditions were and whether there was any icing. He gave me a report and told us not to reduce altitude. We were flying at 20,000, and I relayed that information to the airplane commander.

The weather plane's call was WX-2. That puzzled me because those were the same as the call letters on the weather recon plane that had contacted us out of Sitka. I said to him, "Hey, I thought you were on the ground. Are you airborne?"

He said, "Yes."

I said, "The last time I worked you, you were landing at Whitehorse (Yukon Territory)."

He replied, "I'm a weather-reconnaissance plane out of the 35th Reconnaissance Squad-

ron."

I said, "Where is that?"

But he wouldn't go beyond saying, "Our headquarters is in Newfoundland."

I called Colonel Irvine and said, "Hey,

we've got a weather recon plane."

Colonel Irvine replied, "Let's get on him." So as soon as we could we changed to voice, 4,220 kc., and the weather plane and Colonel Irvine talked back and forth.

Colonel Warren: The soup began breaking up about 300 miles from England. The sun went down. We caught a glimpse of Prestwick, Scotland, and some other towns. Then the undereast became solid. We missed a sight of London and Paris entirely. London told us its Northolt radar station had identified us, but we never did make contact with a British bomber that was supposed to come up and meet us.

We swung about 50 miles south of our course in crossing the Alps, in response to a warning from the Paris radio that thunderstorms were building up ahead of us. We saw none.

Mr. Snodgrass: Just after we cleared the Alps we shut off No. 4 engine and feathered the propeller. That was because we needed so little horsepower—the airplane had become so light—and I couldn't get the total power output down by throttling back. We were pulling only 740 horsepower each from the three remaining engines. That was a special condition with this B-29, of course. We were stripped down and very clean.

Our speed toward the end of the flight was only 174 m.p.h. The drop in speed had to do with the most economical power settings for the weight of the airplane. We could go farther at the reduced speed for our weight. Our fuel consumption at the end was only 156 gallous an hour. Our gross weight was 73,088 pounds when we reached Cairo. All that reduction, of course, was not due to fuel consumption. The engines each used about 38 gallons of oil on the flight.

Colonel Irvine: The worst weather of the trip was still ahead of us after we left the heel of Italy. Over the Mediterranean we ran into thunderstorms, icing conditionsclear ice, too, the dangerous kind—and even a fancy display of St. Elmo's fire. We were all over the sky from the turbulence. Then, suddenly, the weather cleared. All around us were fleecy clouds. Pretty soon the sun came up.

The landing at John Payne Field in Cairo was routine. The Dreamboat tilted her nose

and put her heels on the ground like a lady. With the head winds we had encountered, we figured we would have 500 gallons of fuel left in the tanks. Actually we had 414.

I'll take the Arctic. It's navigable. Communication can be maintained.

Major Hays: Except for what it does to a magnetic compass, arctic flying is just like flying over Missouri.

Colonel Irvine: The Dreamboat stood the trip all right, too. When we got on the ground I asked Master Sgt. G. S. Fish-he's the engineer attached to the Dreamboat and he really owns the airplane, you see—to check up on both airplane and engines.

Pretty soon he came back and reported. "Boss," he said, "all she needs is some gas and oil, and she's ready to go."

END

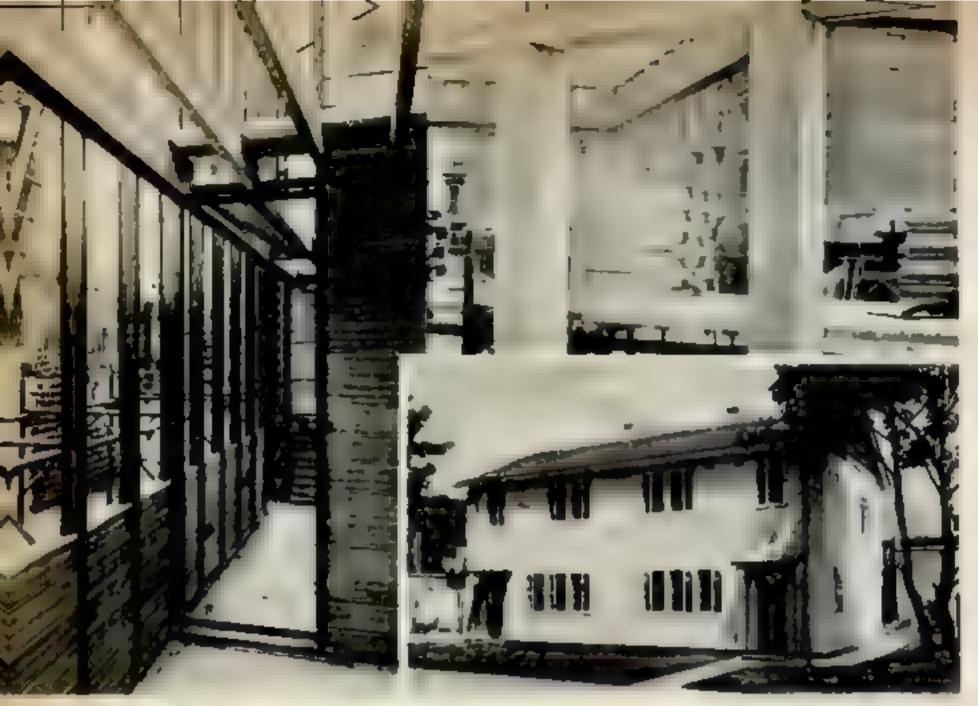

Members of the Dreamboat's crew at Cairo after completing their over-the-top flight: Left to right [standing], Cal. C. S. Irvine, flight commander: Lt. Cal. B. H. Warren, co-pilat, Mais. N. P. Hays and J. T. Brothers, navigators; Maj. J. R. Dale and R. B. Snadgross, flight engineers; (kneeling) Lt. Cal. F. J. Shannon and M/Sgt. E. G. Vasse, radio operators, Maj. J. R. Kerr and M/Sgt. G. S. Fish, aircraft engineers.

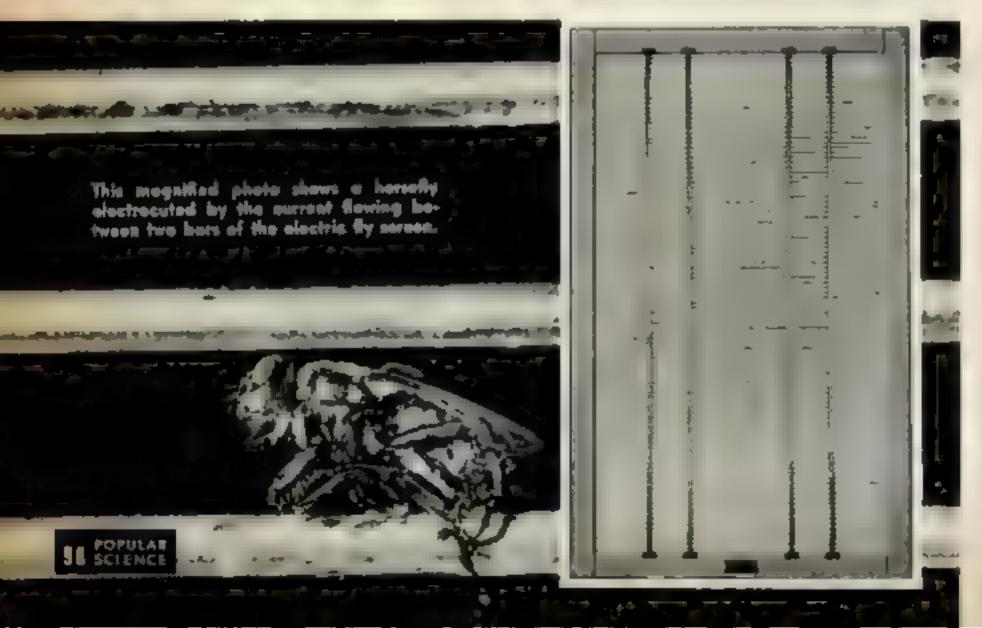

LOCKHEED SATURN. Designed to serve small towns with limited airport facilities, this twin-engine transport uses exhausts for more power and a laminar-flow wing for more speed; takes off with a 1,500-foot run. It needs no special servicing devices, and both passengers and cargo can be taken abourd without ramps.

Britain Mass-Produces Homes. Cranwell House (inset) is one of England's answers to the problem of 4,500,000 homes leveled or damaged by Nazi bombs. Cranwell is a two-home unit that costs \$13 000 and takes three weeks to build. It is built of 3-foot-by-9-inch hollow fire-clay blocks, shown above, at right. Since these are simply dropped into place and locked together, unskilled labor can be largely used

Electric Fly Killer. Fatal to flies and harmless to man, the electric screen shown below, at right, consists of horizontal bars spaced % inch apart, with every other bar positively charged by one pair of vertical struts. The alternate bars are negatively charged by the other pair of struts. Moisture from an insect's body closes the 10-milliampere circuit from one bar to another. The screen is produced by the Detjen Corp.

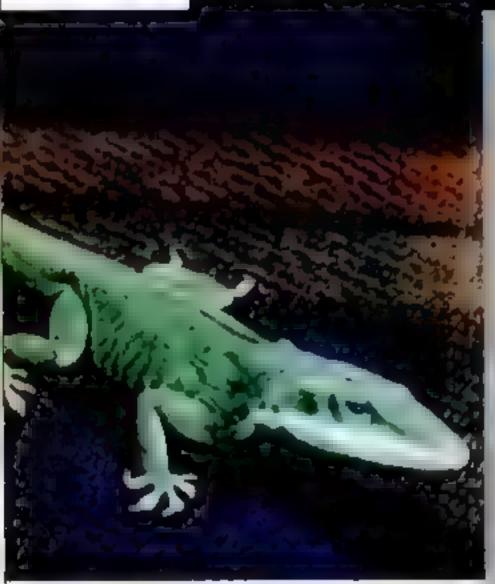

It's pure myth that a chameleon has the innate power to change its color to match its background. The popular fallacy springs from the fact that the sub-lizard does change its has from time to time. But this change has nothing to do with the color upon which a chameleon is placed. It is involuntary; there's nothing the chameleon can do about it. The forces that dictate its color are variations in light, temperature and the way it feels. In the pictures on these pages on American chameleon of the genus Aradia is given ample chance to exhibit its color provess, but it falls down in every instance. At right, the reptile stays green on a red background.

PSM photos by W. W. MORRIS

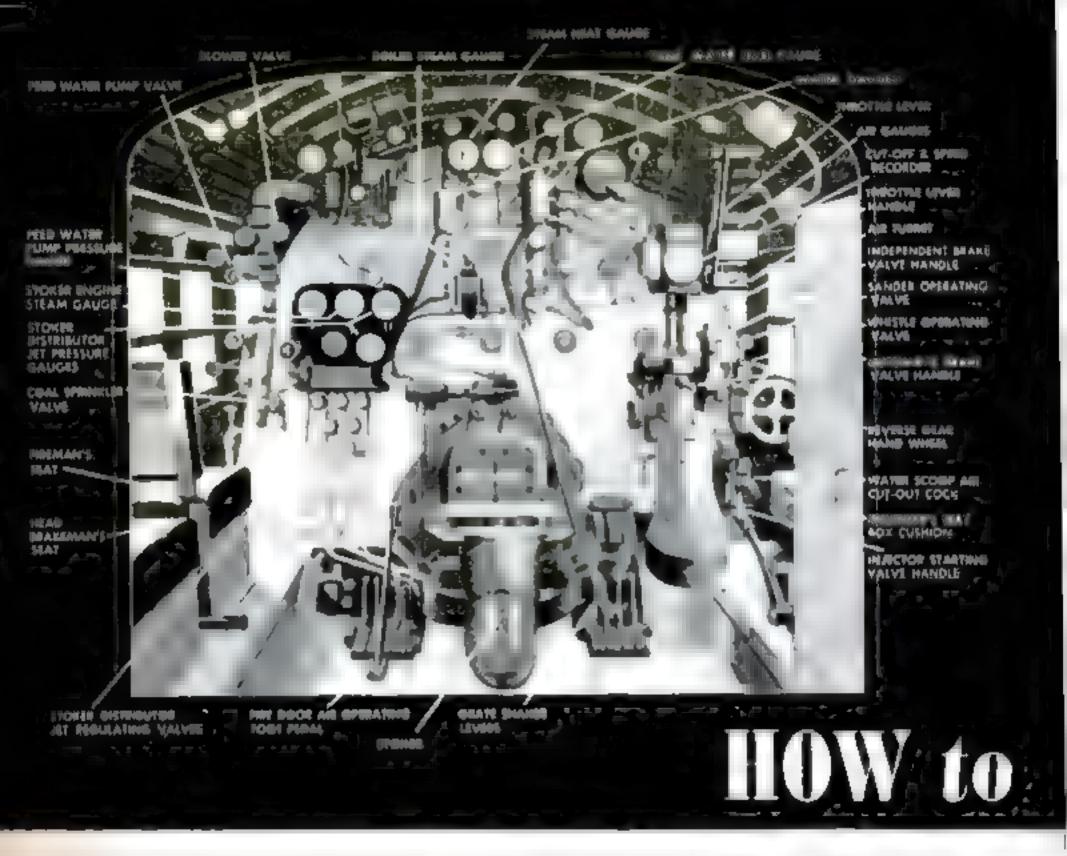

Probably the story of the chameleon that went crazy trying to motch a Scottish ploid has contributed to the unfounded belief that a chameleon can conform to the coloring of its surroundings. When the picture above was taken, the reptile showed no mental instability over its failure to do something about the plaid on which it crouched. Zoologists agree that the sub-lizard assumes a green phase when it is excited, frightened, angered, asleep or dead—and for no other condition.

The color of the plaid on which the chameleon rests is this photo remains the same. Outward conditions have changed; however, and the chameleon has been forced to abandon its green hue for brown. The reptiles take on a brown discolaration in response to low temperatures, hunger or strong sunlight. In this test the creature still displays, so signs of losing its senses over its futile struggle with the plaid. It takes about three minutes for a chameleon to change completely from one color to another.

The chamelean in this picture remains brown against a background of yellow. The New York Zaalogical Society, where these tests were staged, explains that the sub-lizard has three types of color changes: (1) uniform brown above and flacked with brown below; (2) pure, pale green above and white below; (3) mottled brown above and flacked with brown below. Sometimes the color is bright green or intermediate shades of light brown, yellow, yellow green or emerald green. American chameleans are found in Southern states.

Blasting forever its reputation for free-wheeling color changes, the chameleon in this final photo remains brown against a green background. In the picture at the top of these pages the reptile showed that it had the ability to turn green, yet here with all the encouragement of its surroundings it retains its brown color. Broyton Eddy, acting curator of reptiles for the New York Zoological Society, points out that male chameleons in courtship or combat sametimes display a brilliant red dewlap, or throat fan.

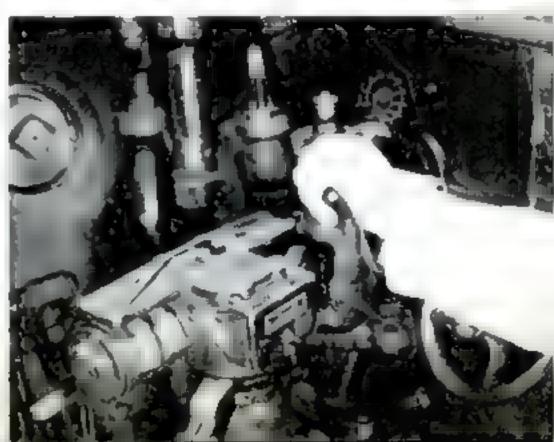

Driving a locomotive is essentially simple, but the finer points of an enginemon's work make it one of transportation's most demanding jobs. The pictures on these pages show the principal parts of the job and give some idea of the myriad details that make

1. With broker, water level, steam pressure and dozens of other items checked, your engine is coupled to a 17-car passenger train. You turn the reversing screw full right for maximum piston stroke. Note that independent engine broke (A) is in "on" position. It had to be set while pictures were taken on a siding. Train brake (B) is in "off" position.

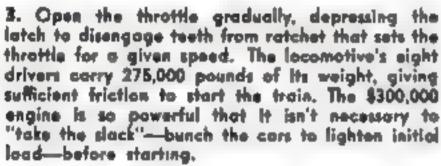

it hard. Above is a simplified drawing of the cab of a New York Central Niagara-type locomotive. With tender two-thirds loaded, the engine weighs 808 400 pounds; It is 115½ feet long. Your seat for the demonstration is on the right of the cab.

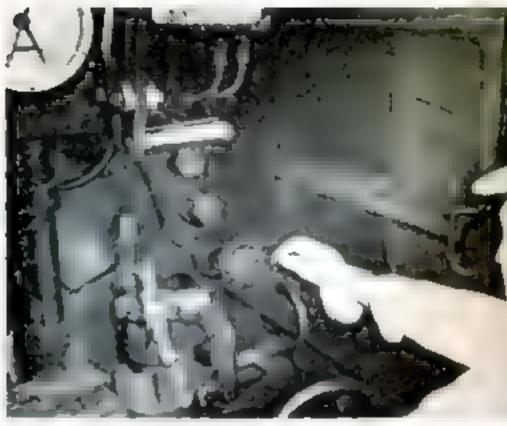

2. You release the independent broke, used to hold train in station, before opening throttle. As train gains momentum, the reversing screw is gradually turned left, toward the neutral position, to shorten piston strake and increase speed. The screw's function is somewhat similar to that of the spark on an automobile engine.

4. To keep from "losing the rail," or slipping, you put some sand on the track—but it isn't as easy as it sounds. The throttle has to be closed to let the engine "drift" during sanding, or the sudden jolt as wheels catch might break pins on drive wheels or loosen their tires. A whistle in the cab blows while the sander is in operation so that engineman won't forget to shut it off.

DRIVE a LOCOMOTIVE

S. Wall on the way, you encounter the first yellow caution signal and slow down so that you can stop within the range of your vision, as the next signal block may order you to do. To pass a caution signal, the forestalling lever is pulled back. If lever is not pulled, brakes will be set eutomatically by the black signal system's safety devices. If the forestalling lever is held back for more than 15 seconds, the brakes set anyway.

6. A clear track ahead. Occasionally, you glance at boiler water level, steam gauge and other dials. If the water level is too high, water may seep into the cylinders, sacrificing power; too low a water level invites damage to crown sheet and a possible explosion. All the way, you keep your eyes open for signals. In engineman's parlance, the track on this side of a signal is yours, that beyond the signal belongs to the rallroad company.

The 19-inch station wagon at right has a hardwood body like an original. The doors open and close and there are enough seats for a whole doll family. Made by Buddy "L" Toys, of Glens Falls, N. Y. About \$6.

At left: A colliage for the nursery circus ma'ss music electronically with regular radio tubes. Produced by Tee Gee Metal industries, of Brooklyn, N. Y., it has shorps and flats to familiarize a child with the piano keyboard. About \$20.

The Return

This year's mechanical marvels are sturdier, more realistic —and more expensive.

At left: This 8½-lb. racing our is driven at speeds of 75 to 90 m.p.h. by its two-cycle gasoline motor. The cast parts are magnesium; the tires semi-pneumatic. It is manufactured by Dooling Bros., of Los Angeles, Calif. Body, \$45; engine from \$22 to \$35 more, depending on type.

At right: When Junior pulls the string, Flippo will flounder along on his flippers ocross the floor, spinning a block on his nose. Flippo, who has no springs or wheels, is manufactured by the Nama Electric Corp., of New York, About \$2.

At right: This streamlined ship, unlike many models, is a liner of the future, not the past. The two-foot E-Z Craft Madel comes as a kit of prefabricated parts to be assembled and painted. About \$3.

104 SCIENCE

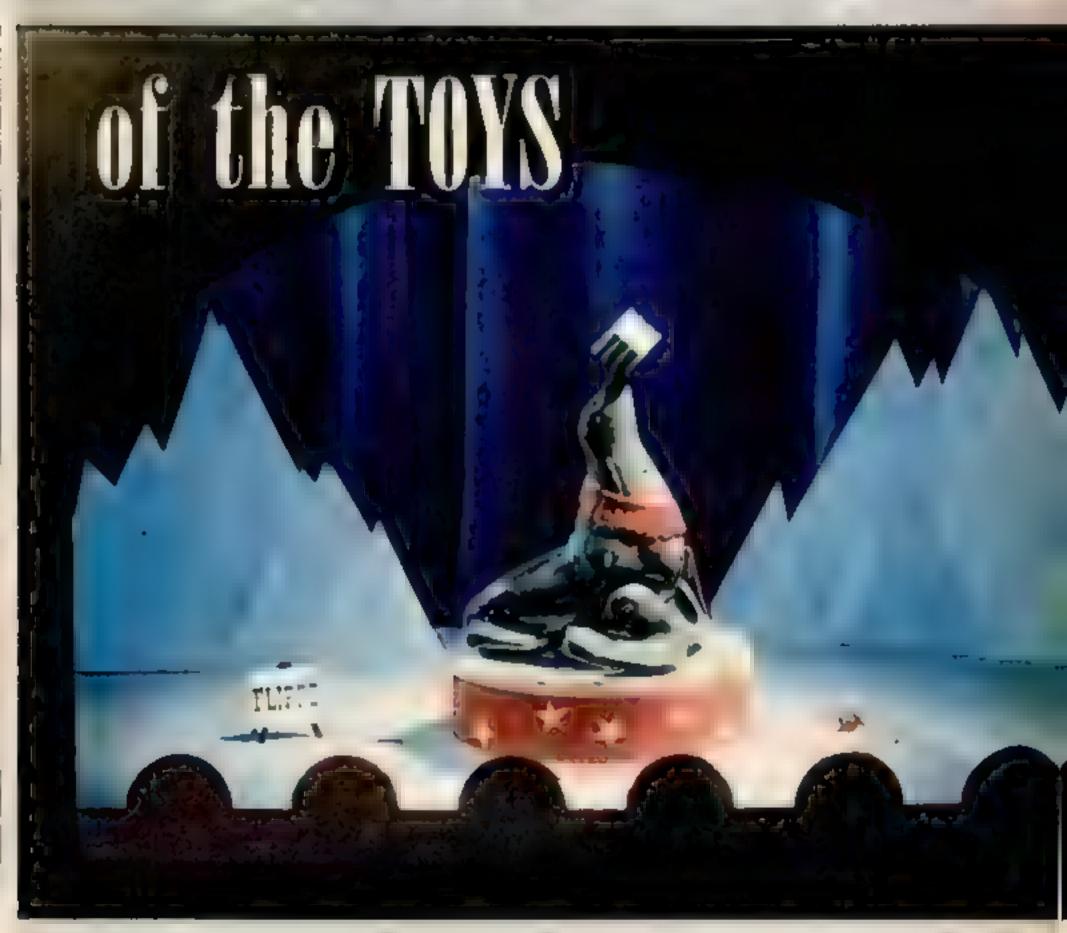

The sturdy little "Buzza" choo-choo, above, goes 'round and 'round and 'round an a self-contained flashlight battery. The current vibrates a spring shoe in the engine that pushes against the notched track. No wires or winding. About \$5.

A child will find himself making invisible ink before he can say "potassium thiocyanate" with Lionel's new Chem-Lab, above. A comic book, each page explaining a chemical experiment, carries him along to the story's conclusion. About \$8,

Salow This 26-pound, 40-inch-long "handcar" operates like the real thing—by moving its hand levers forward and backward. It is made by the Kalamazoo Mfg. Co. About \$18.

Below: This miniature reaction engine is made by Minifet Motors for model planes, racing cars and speedboots. It uses regular gasoline, has a three-pound thrust, weight 16 ounces. About \$35.

New scooters. At left: A three-wheel model made by the Tennessee Aircraft Corp. About \$15. Above: A ratchet-drive model made by Coaster Craft Scooter. About \$15.

Above: Bridges, skyscrapers and a variety of other structures can be built with this aluminum construction set. It includes a riveting tool and blue-prints. It is a Fax Toy Co. product. About \$3.

Above: In the summer the Sledmobile can be used as a wagon and in the winter, with Its cotter-pinned wheels removed, as a sted. It's a space saver—and handy. About \$30.

At right: Keeping up with the times, model-airplane builders now stress jet planes. Mel Farrell's Shooting Star kit is made to scale. About 75 cents.

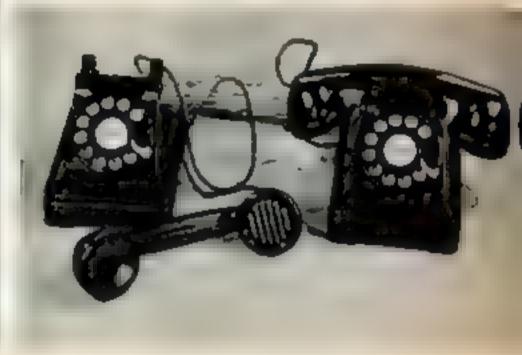

Below: Precision-molded for balance, with a smooth surface that reduces air and point-of-contact friction, the plastic top is a marathan spinner. Made by Plastic Molded Products, Inc. About 50 cents.

Below: Knee-action wheels are featured in the Keeca Flyer aluminum ratter skates. A pair of the skates weighs a pound, needs no oil About \$7.50.

Below: This three-quarter-size telephone set can be used for room-to-room calls. Flashlight batteries supply its current. Pengo, Inc., makes the set, which includes 50 feet of wire. About \$12.

Below The 81/2-pound McCoy car has gone 116.4 m.p.h. A ram-air-intake gas engine costs from \$22 to \$35; the car, without engine, about \$42.50.

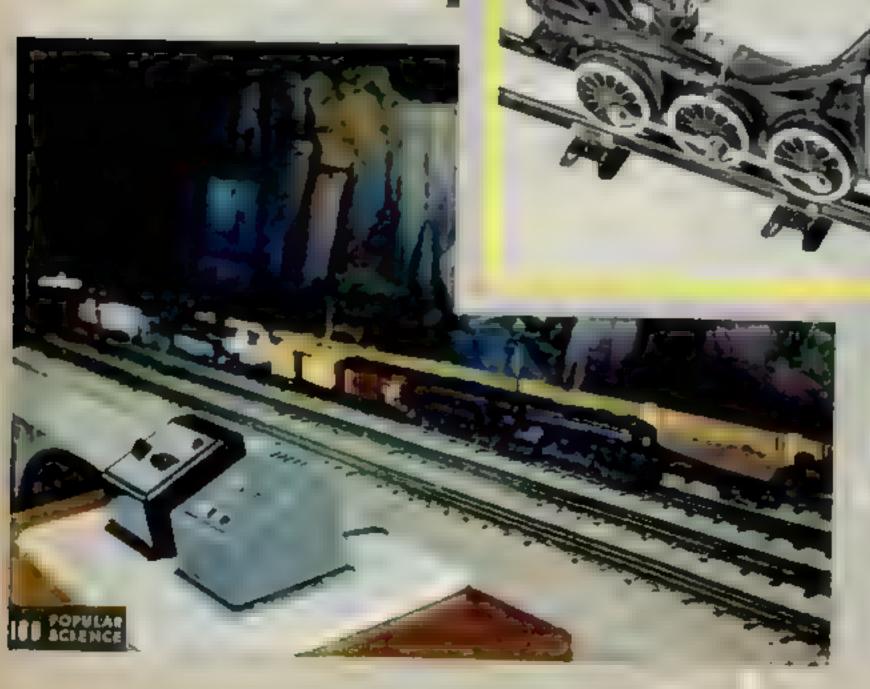

A magnet hidden in his mouth enables Nippy the Pup to snap at a metal-cored plastic bone and hold it fast. Made by Winchester Toy Co., of Philadelphia. About \$6.

Lionel trains have gone electronic. Ten different medium-frequency waves, controlled by buttons on the transformer below, stop and start trains, couple and uncouple cars, sound the whistle, and activate unloading devices—all anywhere along the line. The tiny receivers are no bigger than a watch. The smoke-puffing train in bottom photo sells for \$75. Service stations will convert older types.

Below: Gilbert's American Flyer trains are now powered by motors developed to operate Grummon Hellcat wing flaps. The locamatives smake, too.

Below: The scale-madel American Flyer cars are plastic and weigh only one-third as much as metal cars, permitting longer, more realistic trains.

Above: From England come these miniatures of standard English automobiles, powered by spring motors. They are made by Tri-Ang Minic Linus Bros., Ltd., of Landan. The larger types, \$2; the smaller, \$1.25.

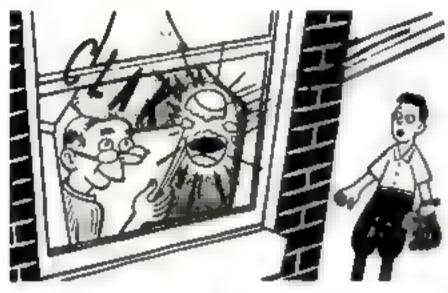

Latent construction talents of the playroom set can be developedif father doesn't steal the actwith the Vinylite plastle building sets produced by the Du Page Plastics Co. A complete village (upper right) of 30 buildings con be built with plastic bricks (above), scaled 1/4 inch to one foot, in building, downts are inserted in a perforated baseboard and the blacks are slipped on the dowels. The village comes with homes, stores, factory, public buildings, gas station, theater, hamburger stand, airport building and a real electric-light plant. Then there are windows, doors, shutters, flower bases, imitation glass bricks, sandpoper strips for streets, and toweling to represent grass and shrubbery. The boy at right is building a typical home. Below is a wall showing the supporting dowels. The sets come in 10 sizes, the smallest with 400 pieces for \$4, the largest with 3,500 pieces for \$27.50.

I'd like_

Curioons by SYD LAND! Everybody has his own pet idea of some pudget he would like to see in general use. What is YOURS? Papular Science Monthly will pay five delices for every such suggestion that its aditors decide to publish.

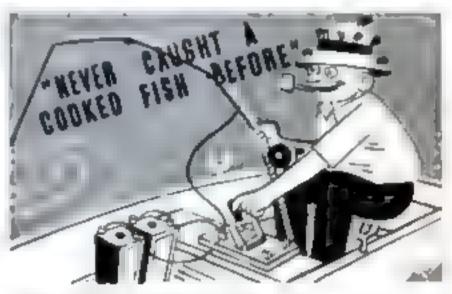

Ball-Repelling Panes. Windowpanes of a plastic able to shrug off a wild baseball without damage would be reassuring to Frank Raimo, Jersey City.

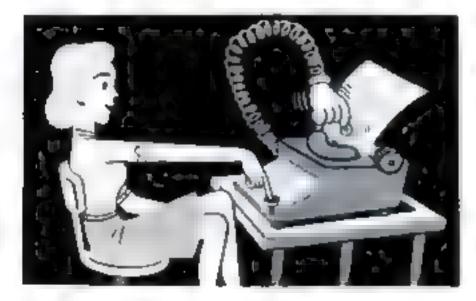

Succes Trap. Coughers or sneezers who attend shows and concerts should carry small, soundproof boxes to catch their noises, thinks Hildagards Herzinger, Chicago.

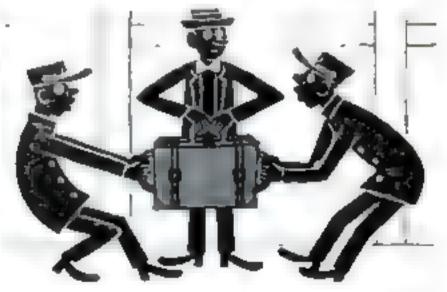

Bandit Catcher. To disarm bandits, James Ledbetter, Atlanta, Ga., would equip stores with loudspeakers that, when set off by a clerk's foot, bark "Drop that gun!"

Electric Fishhook. To stun hooked fish and make certain the big ones are landed, Paul G. Cluver, Watseka, Ill., suggests a fishhook charged with electricity.

Eraser Key. An extra typewriter key that would merely have to be pressed to erase mistakes would be a boon, according to John Dosland, Moorhead, Minn.

End Handles on Luggage. Aboard crowded trains, end handles would let bags be carried the long way and thus save space, says Mrs. Robert Graham, Cameron, Ill.

Plastic Bearings Tell All

TEW transparent plastic replicas of bearings are helping Westinghouse engineers design smaller motors with more power. They can look right into the bearing while the machine is running and watch the oil, dved red, flow into the various parts of the bearing. Thus a check can be made on whether the seals are working properly, oil passages are allowing the correct flow of lubricant, and relief points are properly located. Bad design starves some areas of oil and the bearing cannot carry a full load. Previously, designs were determined largely by trial and error. The bearing models are machined out of Lucite with the same close tolerances as the metal originals.

Camera Theodolite Tracks "Old Needlenose"

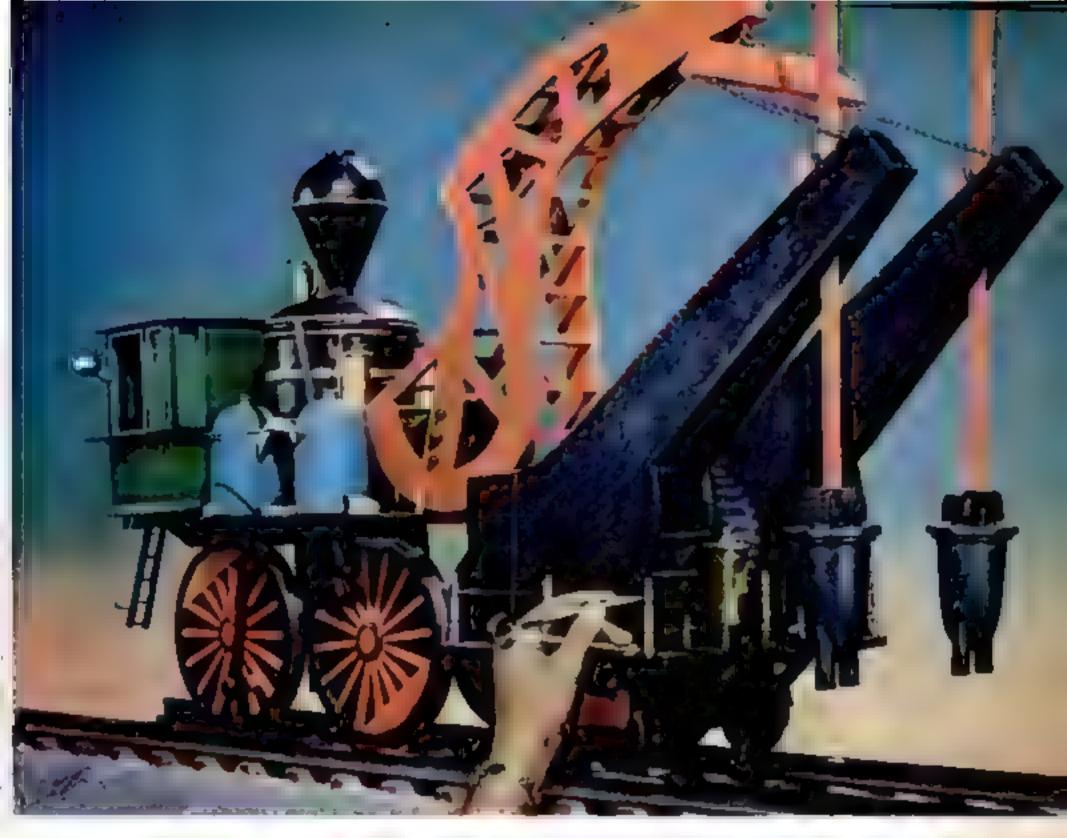

FOLLOWING the flight of pilotless aircraft that travel at supersonic speeds requires special instruments. The tracking theodolite, below, is equipped with recording apparatus and geared to an automatic motion-picture camera. By using this device in combination with radar, a missile can be followed from the moment of launching until it comes to earth again. The theodolite, being examined by engineers S. L. Lewis and Waine Archer, permits a permanent record to be made for later study.

Bootng photos by Yerns Manton.

The camera theodolite was developed for use with Boeing's "Gapa" rocket, here shown soaring aloft. Theodolite and radar stations, one to six miles from the launching tower, will record flight of the missile, nicknamed "Old Needlengse."

Inky Pao the machine that drives spikes by the pair, is John Henry's opporant, it is an imaginative creation of plastic, metal and rubber to delight any model maker. Hand indicates the scale.

Ingenious Models Bring John Henry Folk Saga to Movie Life

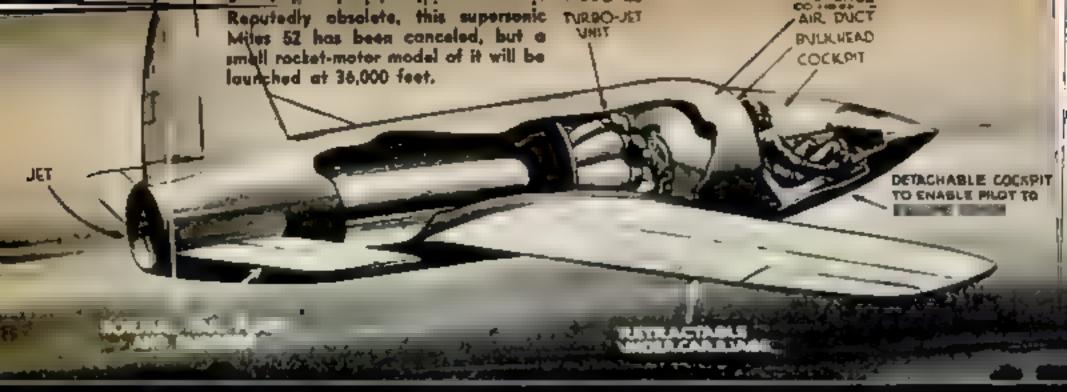

JOHN HENRY was the fabulous superstrong man of the workers who built the railroads, just as Paul Bunyan was of the lumbermen. John Henry's great contest against the machine is an epic of American folklore. Now George Pal, cartoon-movie maker, has brought the story to the screen, matching John Henry against a fantastic steam track-laying and spike-driving machine named "Inky Poo," Seven plastic torsos, 73 pairs of wooden legs and 42 rubber heads make John Henry "move," and Inky Poo, of course, is also shifted into a new position between each frame.

laky Poo and John Hienry start at the mouth of a tunnel to see who can first lay track to the finish.

True to legend, John Henry wins the roce with his mighty hammers flying but kills himself to do it.

Britain Goes Supersonic

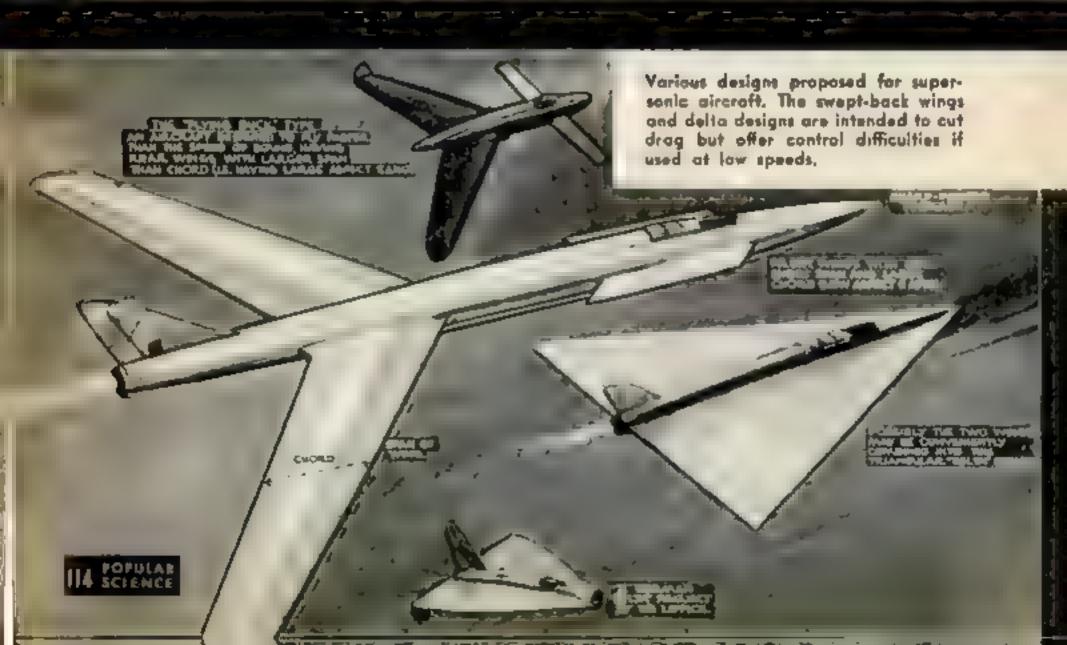

Engineers race to design first plane to fly faster than sound.

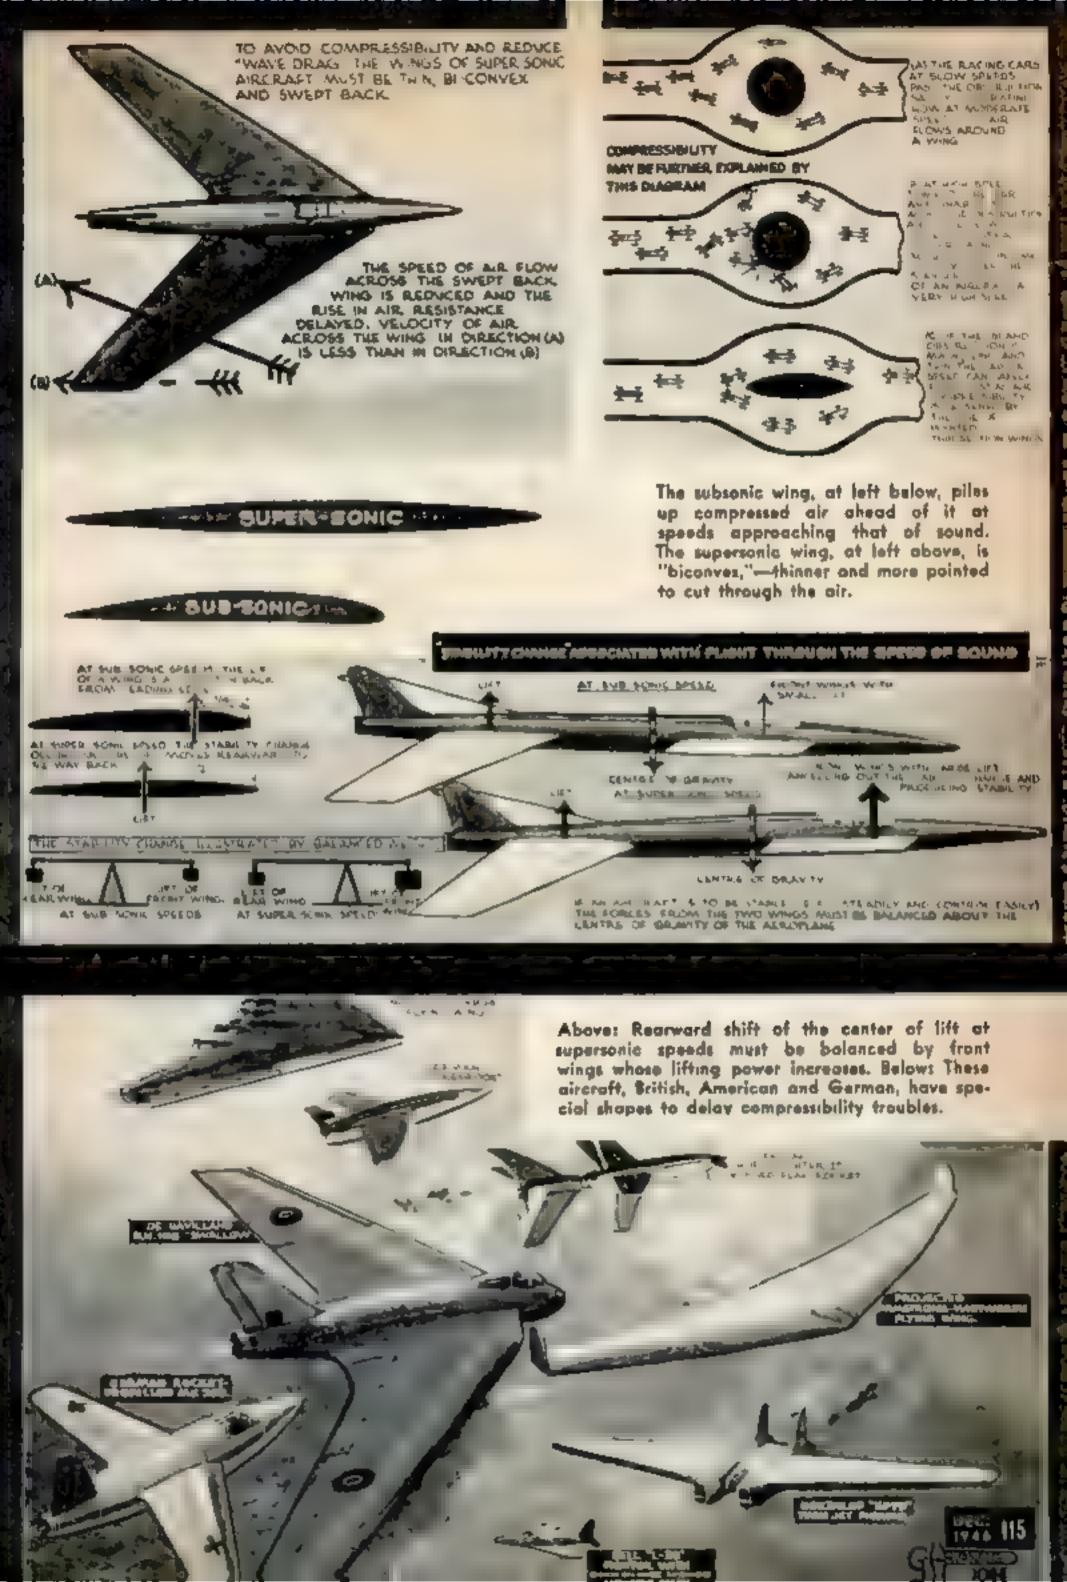

BRITISH engineers are making an all-out attempt to build aircraft that fly faster than the speed of sound. To do it they are concentrating on developing gas turbines, jet propulsion and rocket engines.

British airplanes have broken existing world speed records in recent months. Now British experts are developing engines and planes to set fresh marks. Hint of what they are like is given by the canceled Miles 52, apparently obsolete even before completion. The M-52's 17,000-hp, three-stage power plant almost filled the fuselage. Ex-

haust from a jet engine with centrifugal blower ran a gas turbine. This brought more air into the stream and pushed it into a duct. Here more fuel was burned to give an extra push. The plane was expected to hit 1,000 m.p.h., 250 m.p.h. faster than sound. The ones under wraps presumably are planned to do even better.

The solution of supersonic difficulties is complicated by the fact that ordinary wind tunnels cannot be used for testing. Air bounding off the sides sets up disrupting currents, and a shock wave "chokes" the tunnel. For this reason British engineers are using various types of pilotless models, some dropped from high altitudes, some depending on rockets.

Conveyor-Relt Harvesting. Lettuce and other crops on big western ranches are being gathered more quickly with the help of conveyor belts like the one shown above in an Arizona lettuce field, Fifteen men feed each of the belts, which move through the huge fields at two miles an hour.

The belts, rumbling along on gas-pipe rollers, are 30 inches wide and 135 feet long, and each is powered by two 85-hp. Ford engines. They carry the produce up above tractor-drawn trailers and drop it into steel baskets. The machines are made by the Gaudin Motor Co., of Salinas, Calif.

Aluminum Rowboat. Douglas Aircraft makes this rowboat of airplane-type 040-gauge dural. The surface is anodized to make it corrosion-proof, seams are riveted and spot welded, and air tanks maintain buoyancy even if craft fills with water.

Durable Orchid. Made of Lumarith plastic, the once-fragile orchid becomes washable and long-wearing. William Farris, of Alhambra, Calif., began making the flowers in a navy hospital; now 10 disabled veterans turn them out in his home factory.

CRAFTWORK

PROJECTS OF THE MONTH ?

SHOPPING days before Christmas don't count when the presents are turned out in your own home workshop. Despite appearances, the three projects here can be built in short order, and with little cost for the materials used.

TIN-CAN STOCK IN THE LAMP shown at top is good material for decorating with paint and decals and may be out from a 2- or 5-gal, can. The project is described an page 162.

A GAME OF SHOOTING DISKS, in the photo at center, eally for just enough skill to give all members of the family a thrill. How it is built and played is told on page 151.

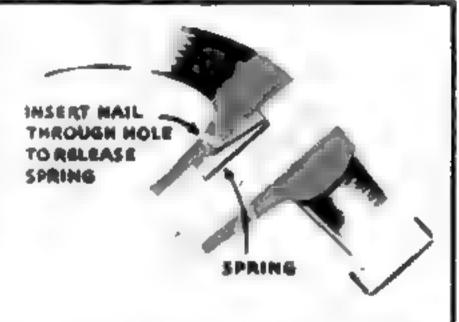

DIMPLES IN COLOR make the little basket of clear plastic just at left something different. Construction steps are also an page 161.

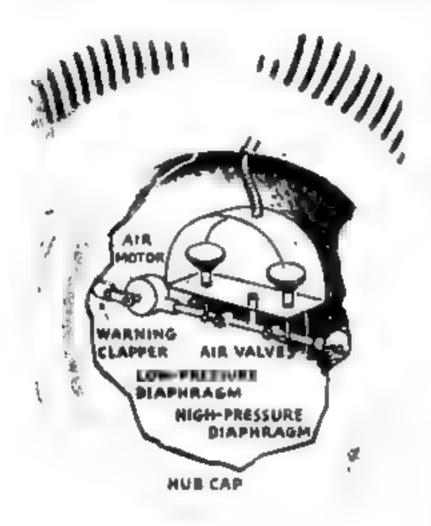

NEW IDEAS from the INVENTORS

Combination Spoon and Fork. This ingenious instrument, designed by Samuel Lapin, of New York City, works both ends with one handle. One end is a conventional spoon; the other, a two-pronged fork. It spoons or spears fruit from a jar, or from a drink that it also stirs. The fork is suitable for sea food.

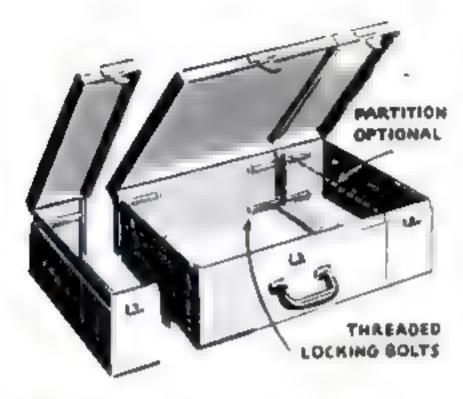

Hammer-Head Lock. The menace of hammer heads that fly off the handle is met by a device developed by Vincent Iavarone, of New York City. The inner face of the hole in the head is notched and the handle recessed to hold a hairpin-shaped spring. The two ends of this spring, pushed together when the handle is forced into the hole, spring apart once it is in position, catching one end in the notches and locking on the head.

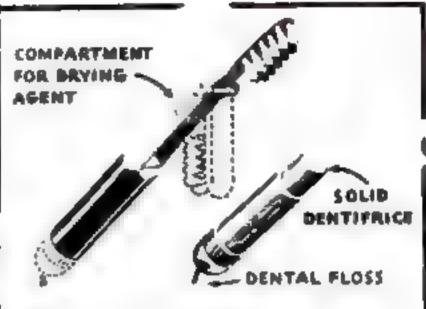

Leaky-Tire Alarm. A clapper warns you of improper tire inflation in a device invented by Arthur M. Heath, of Houston, Tex. A double-action valve, set inside the hub cap and connected with the inner tube, remains closed only when the pressure is just right. Low pressure or over-inflation opens the valve, allowing air to operate a tiny motor that bangs the clapper against the inside of the hub cap.

Expansible Suitease. Added room to cram in an extra pair of shoes without bulging the suitease is provided in a novel piece of luggage invented by Pearl Frandsen, of New York City. Extra compartments can be bolted to the ends of the suitease to provide more space. Any of the three sections can also be used individually.

Pocket Toothbrush. A toothbrush as easy to carry as a cigarette lighter is the invention of Marcel Boulicault, of Ladue, Mo. The head folds back into a recess in the handle, connected to a supply of moistureabsorbent and disinfectant material to keep the bristles in proper condition. Dentifrice and dental floss are in a dust-proof cartridge in the handle.

Mechanical Flash Lamp. A sig-

nal light needing neither electricity nor fuel has been invented by Robert A. Adams, of Brawley, Calif. Eight filnts, set in a circle, spark simultaneously into a reflector when a button is pushed. Corrugated wheels set next to each filnt are geared to as fiexible shaft, which is turned by a spring in the handle to spark the filnts.

FLEXIBLE SHAFT

PUSH-BUTTON

COILED BAND SPRING

WINDING COLLAR

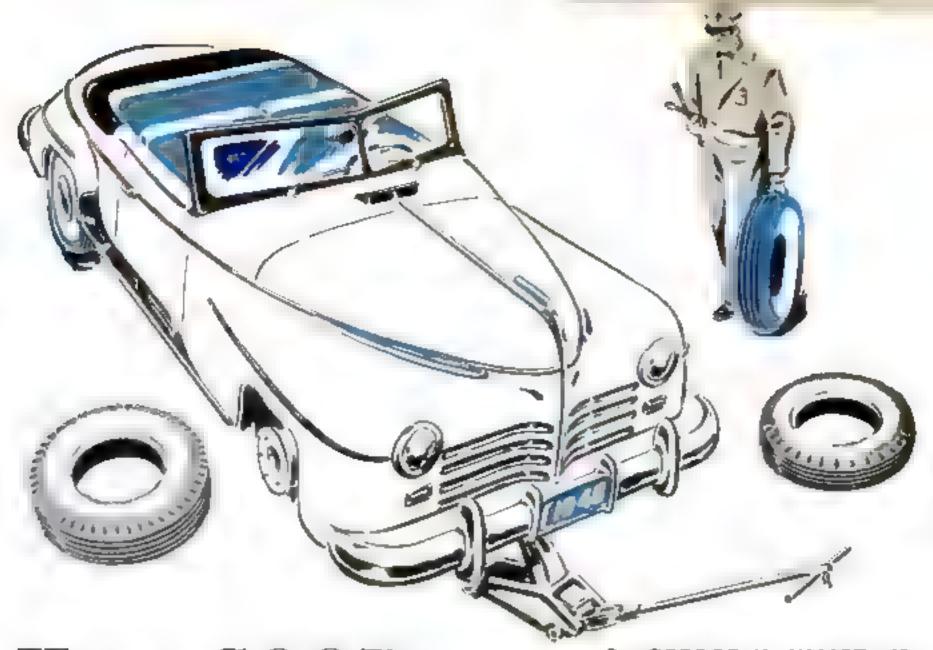

Turret Truck. Something new in equipment for moving factory materials is a truck with its power plant and drive wheel built as a single rotatable unit. The design eliminates the need for a reverse

gear. Power is supplied by a six-horsepower. single-cylinder, air-cooled engine through an automatic transmission and clutch. The truck, a Salsbury Motors, Inc., product, attains a speed of eight miles per hour.

300-M.P.H. Air Liner. Sixty-eight passengers can be carried by day and 26in berths-by night in the new Douglas

DC-6, a four-engined, 8,400-horsepower transport that cruises at 300 m.p.h. The cabin is pressurized, sound-insulated and air-conditioned. The red on the outboard engines on the plane in the picture below signifies that it is on an experimental flight. unit used on the DC-6.

How Good are Synthetic Tires?

Very good—and getting better: they'll be tougher and good-looking, too.

IN LESS than five years you will be able to buy a tire that will go 100,000 miles—much farther than most owners drive their cars. Dr. R. P. Dinsmore, the Goodyear Tire and Rubber Company's vice-president in charge of research, makes this prediction. Improved synthetic rubbers used in smarter ways will make that tire possible.

Our first synthetic tires were poor substitutes for the natural article—they were out quickly at normal speeds. They cracked, they overheated, they tore apart. But each year brought improvements, and by pooling research efforts the major rubber companies, under the Government Office of Rubber Reserve, soon produced a synthetic tire that would stand up. Today, severe road tests prove that the modern synthetic tire for passenger cars wears as well or better under normal use than the prewar natural-rubber product. As for inner tubes, today's synthetic tubes have proved themselves so far superior in some respects that natural-

rubber tubes may never again be produced,

During the war the rubber industry's production problem was one of quantity. Milhons of tires were needed by our armed forces and our civilian transportation system. Now, the tire makers can concentrate on quality. Research is progressing in many directions. By using radioactive isotopes in blends of synthetic mixtures, laboratory technicians are seeking particularly to find out more about special-purpose rubbers. With radio-sulphur in place of ordinary sulphur, they hope by the tracer technique (PSM, May '46 p. 91) to solve the secrets of vulcanization processes for both synthetic rubber and natural rubber. By studying the molecular construction of synthetic rubber, they hope to learn why it has a tendency to heat up more than natural rubber when it is flexed.

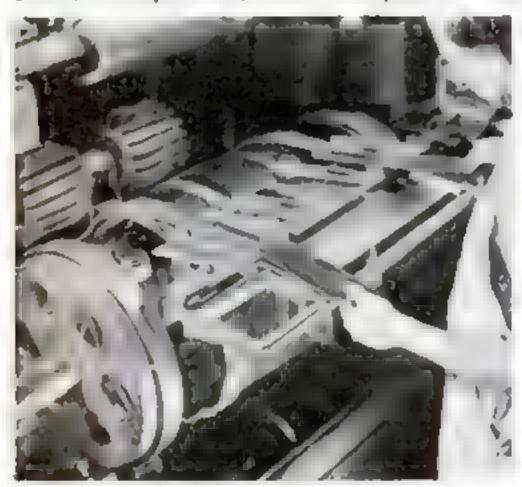

One of the biggest pieces of research news to come from the rubber laboratories recently is "white" carbon black. For 35

1. First step in making a 6.00-16, four-ply tire with new semiautomatic machines is to place inside beads over collapsed drum, which is then expanded.

2. As the drum rotates, tire builder lays on first of fabric plies, cut on proper angle. This method assures uniform product, lessens emphasis on skill.

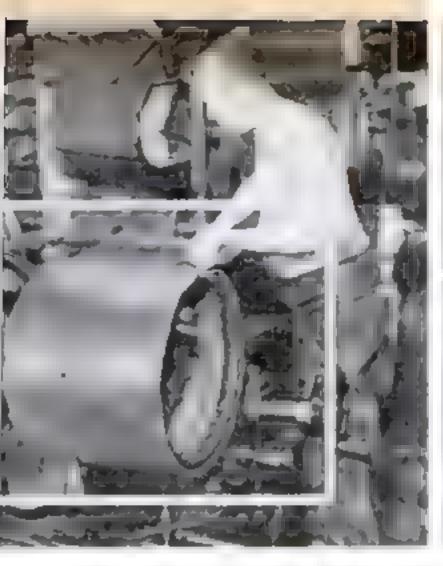

4. When final plies and a breaker strip have been added to the tire structure, strips of fabric known as "chafers" are applied. These are to keep beads of the finished tire from chafing against wheel rim.

5. In applying tread, upon which the design appears after tire is bagged and cured, the operator merely guides material; as in other steps, machine supplies precision, this time with a tread roller.

years tire builders have used carbon black—ordinary black soot—as a binder to give added tear resistance, abrasion resistance, and tensile strength. This meant that all strong rubber had to be black. To build whitewall tires, strips of weaker white rubber had to be bonded to the outer wall of the black casing. With "white" carbon black, pure white—or even baby blue, orchid, or

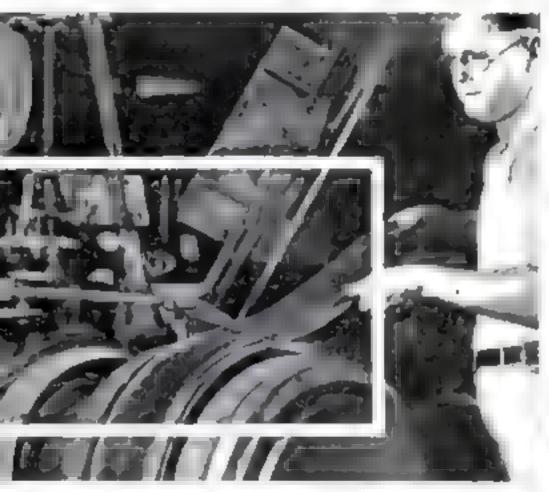

almost any shade to suit the color of your car—can be made with all the strength and wearing properties of black rubber. "White" carbon black, a development of B. F. Goodrich Company, is made from an easily obtained natural source—white sand. Ethyl silicate, a highly volatile liquid obtained from sand and alcohol, is burned and white soot results.

For contrast, here is the prewar system of laying on plies. With such machinery, finished product a quality depended largely on desterity of operator.

3. After beads are set by the machine, automatic stitchers come into position to make a turn-up of the first two plies, securely wrapping the beads.

The old method of putting on a tread. Here again, besides being slower, the machinery allowed greater chances of human error and put most of the responsibility for quality on the operator.

6. Looking like a barrel with both ends removed, tire is taken off the collapsed drum. Operator gives it a quick check before placing it on conveyor to go to inspection station. (Goodyear photos.)

Research has also improved tire manufacturing methods. Before the war, the building of a tire was primarily a hand operation. Much depended on the skill and dexterity of the individual worker. Now semiautomatic machines controlled by a network of photoelectric cells and electronic tubes turn out uniform tires more than 50 percent faster than the older methods. Even when we again can get all the crude rubber we want from the East Indies—a matter of 12 to 18 months—synthetic rubber will probably still be used to make a lot of passenger-car tires. First, the current high price of 23% cents a pound for crude rubber, as against 18% and possibly 15 cents for synthetics, favors synthetic rubber. The average automobile tire uses about 11

pounds of rubber, so the raw-material cost for natural rubber would be at least 55 cents more. Second, rubber experts have tremendous faith in future synthetic developments. And we have a \$750,000,000 in vestment in Covernment-owned synthetic rubber factories

At present, as during the war, we are producing four principal types of man-made rubber: GR-S (Government Rubber-Styrene); GR-I, or butyl rubber; GR-M, or neoprene, and GR-A, or buna-N.

GR-S is the standard bulk, general-purpose synthetic rubber for tire casings, shoe soles and heels, rubber boots and mechanical goods. More of it is made than any other synthetic rubber. It is doing a good job of filling our needs, but rubber technologists are by no means convinced that it is the ultimate. They feel that research eventually will come up with a man-made rubber that not only will be "just as good or better" but will far surpass nature's product.

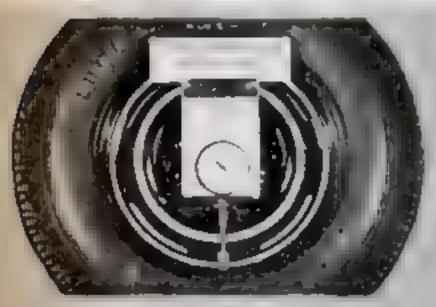

In a single laboratory maintained by the Office of Rubber Reserve at the University of Illinois, at least 50 new types of synthetic rubber have been produced. One of these, called sodium rubber, shows promise in laboratory tests of being a better general-pur-

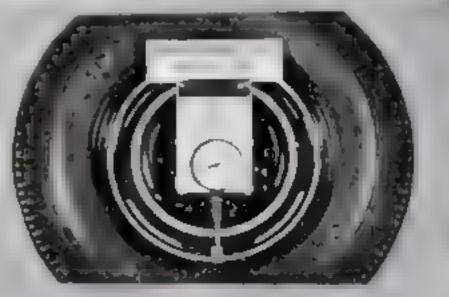

Why butyl tubes are better: Natural rubber, above, tends to tear if punctured. Butyl, below, does not tear and actually alongs to noil. A 90-mile test run with identical noil-pierced tires left a natural tube flat while its butyl rival still had 25 pounds' pressure, 10 pounds of which it held for 12 hours.

pose product than CR-S, particularly in its resistance to overheating and cracking—important in the manufacture of tires. Enough of this new sodium rubber has been pro-

A comparative air-diffusion test shows why prewar tubes needed air every two weeks while butyl tubes require attention only three or four times a year. Tire with natural tube, above, lost seven pounds' pressure in three weeks; butyl

tube, below, lost none, Butyl's superiority is important because a four-pound pressure drop, particularly in synthetic casings, cuts fire life more than 15 percent, boosts gasoline consumption by one gallon in 12. IU. S. Rubber Co. photosi

duced experimentally for use in a test tire.

GR-I, or butyl rubber, is the one that gives us our better-than-natural rubber tire tubes. Butyl inner tubes have proved far more durable than those of the natural product. Once inflated, they hold air 10 times better than a natural-rubber tube, and they perform much better after being punctured.

Our two other synthetic rubbers—GR-M and GR-A—both have proved excellent for specific purposes, in which they out-perform natural rubber. GR-M's superior properties are its resistance to chemicals, oil, heat, air, light and flame, making it valuable in the production of oil-resistant hose, electrical insulation, gaskets, aviation gasoline tanks and belting. GR-A, both oil and cold-resistant, is a perfect material for self-sealing fuel hose and fuel tanks for airplanes, oil-proof and coldproof fabrics, and as a binder for abrasive wheels. These two synthetics perform jobs that natural rubber could not do.

The end of the war brought no lull in synthetic production. On the contrary, 1946 will be the biggest production year in the history of the industry. By years end we will have used approximately 1,000,000 long tons of rubber (a long ton equals 2,240 pounds), over 70 percent of it synthetic. In 1940, the record prewar year, the total was 651,000 tons, of which only 2,500 tons

were synthetic. In 1947, with more natural rubber available, the balance is expected to level off to a 50-50 percentage

One plan in the minds of tire builders is a combination of synthetic and natural rubbers to produce a supertire that will be superior to one made wholly of either. Each product would be used as an independent building material—natural rubber in the spots where it does the best job, synthetic at the points where it excels.

The rubber industry's research chemists today have two main goals: to produce a synthetic rubber that can be tailor-made to fill every need, and someday actually to synthesize natural rubber from chemicals.

In the offices of each of the major rubber companies stands a row of half a dozen or more three-drawer metal filing cabinets. These contain the thousands of reports issued by the Office of Rubber Reserve outlining the results of all experiments and tests made by the Government and the rubber companies since the start of the war. According to Dr. Waldo L. Semon, famous rubber technician and director of research of the B. F. Goodrich Company, "Those files may well contain the hint that will lead to a synthetic rubber better than natural rubber or any man-made substitute so far known."

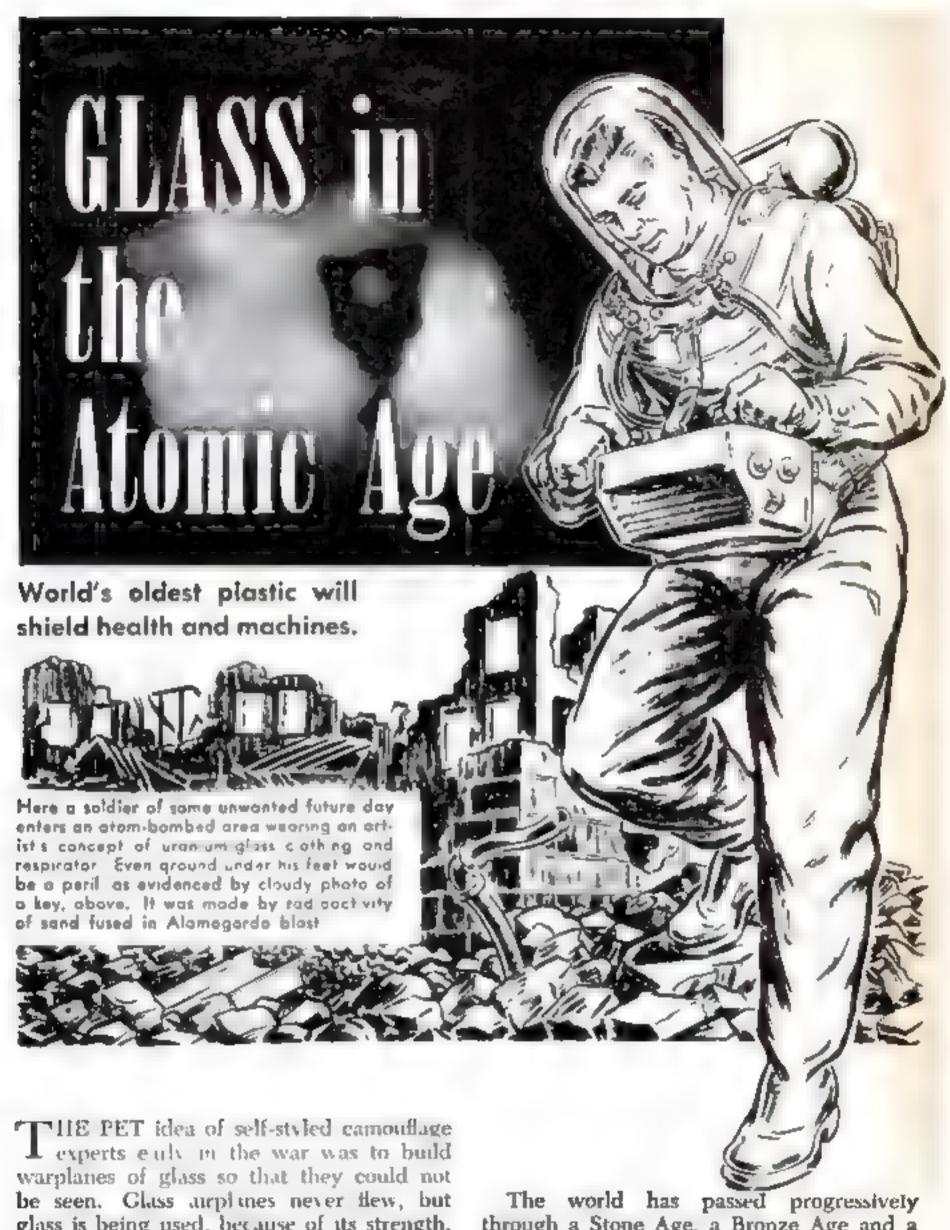

Perhaps even a tire that will last as long as the car is not too much to expect.

A One-Minute Primer of Synthetics

TYPE	MAIN INGREDIENTS	MAIN USES
GR-S (BUNA-S)	Petroleum or Alcohol (Butadiene) and Coke (Styrene)	Tire Casings (As good as natural for passenger-car tires)
GR-I (BUTYL)	Petroleum	Inner Tubes (better than natural)
GR-M (NEOPRENE)	Acetylene, Salt, and Sulphuric Acid	Heat-, Oil-, and Flame- Resistant Rubbers (better than natural)
GR-A (BUNA-N)	Crude Oil or Alcohol (Butadiene) and Acrylonitrile	Oil- and Cold-Resistant Rubbers (better than natural)

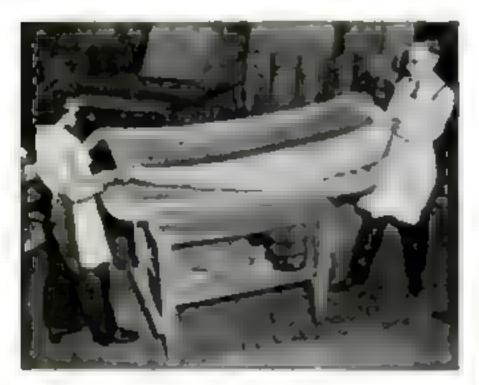

THE PET idea of self-styled camouflage experts early in the war was to build warplanes of glass so that they could not be seen. Glass airplanes never flew, but glass is being used, because of its strength, in airplanes, artificial arms and legs, bullet-proof armor, arctic clothing, boats and canoes, fertilizer, surgical bandages and fillings for teeth. One large glass company now is producing glass in more than 4,000 different forms and has experimental projects covering some 300 m or not artial uses.

The world has passed progressively through a Stone Age, a Bronze Age and a Steel Age. Glass experts believe that we now are entering a Glass Age.

A major glass-research program at the University of Pittsburgh, directed by Dr. Alexander Silverman, head of the University's chemistry department, is aimed at the solution of some of the age-old secrets of

glass. By using radio-isotopes as tracers, Dr. Silverman hopes to find out how the raw materials in glass melt, how the glass flows during melting—and what causes defects in glass. His findings may take many of the "ifs" out of glass manufacturing and open important new fields for future research regarding the world's oldest plastic.

A firm behever in a Glass Age, Dr. Silverman foresees great advances within five years. One of his most spectacular prophe-

7. Mustrative of the many new uses of glass is the making of molds that permit electronic vulcanization of spange-rubber auto seat cushions. First step is to place glass-cloth layers on wood form.

cies is that glass will be used as a defense against the atomic bomb. The same element that is used to make the bomburanium—can be used to produce a glass that provides good protection against harmful radiations. Garments and helmets made of cloth spun from uranium-glass or lead-glass fibers, says Dr. Silverman, would permit safe entry into atom-bombed areas. Special oxygen respirators, equipped with glass-insulated high-frequency precipitators, would keep radioactive dust out of lungs of rescue workers.

One of the most important recent glass-fiber developments is the perfection of a method for reinforcing other plastics with glass, just as we reinforce concrete with steel rods. Glass-reinforced plastics have many metal-like qualities, yet can be fabricated easily and inexpensively without complicated dies or high-powered presses. Almost as light as aluminum, they have the strength of many of our stronger structural metals. Designers and engineers are finding them ideal for use in molding railroad-car, bus and automobile bodies, airplane fuse-

lages and parts, boats and canoes, fishing rods, luggage, football belmets, artificial arms and legs, furniture, kitchen and bathroom assemblies and home appliances.

Fabricating a glass-remforced plastic product is like making a layer cake or using a pressure cooker, and almost as simple. The process is similar to that used in making low-pressure laminated plastics, except that glass cloth is used in place of plywood, sisal or paper as the filling for the plastic sandwich (PSM, May '46, p. 122). Successive layers of glass-fiber cloth, impregnated with the desired liquid plastic, are simply laid one on top of the other in a form,

2. When enough of the resin-impregnated layers have been applied, the mold is put in a rubber bag for curing. Fiberglas materials, used in this process, meet all the varied demands of electronic heating.

or mold, of the desired shape. When enough layers have been built up to obtain the required thickness and strength, heat and pressure are applied in an autoclave that resembles a giant pressure cooker.

Technologists are devising all sorts of new uses for glass cloth and glass fibers. The same qualities that have made glass cloth valuable as heat-insulating material for use in buildings, but tops and airplane cabins are now being put to use in new arctic clothing being tested by the U.S. Army. Field jackets, parkas, boots and mittens lined with glass cloth are expected to give good lightweight protection against subzero temperatures. An experimental glass-cloth-lined parka, worn by an observer during the recent Operation Musk Ox in northern Canada, afforded complete comfort at temperatures as low as -40 degrees F.

Glass-reinforced plastics also have made possible a lightweight bulletproof body ar-

mor for soldiers, which surpasses metallic armor in ballistic efficiency. Doron, as the glass-plastic armor is called, will stop missiles up to and including a .45-caliber revolver builet. At the moment, Doron armored jackets are undergoing rigid tests in the jungles of Colombia. Eighteen jackets have been supplied to American scientists and drill crews of an oil company, several of whose employees have been wounded by natives.

Other experiments under way include the use of milled glass fibers as a reinforcing

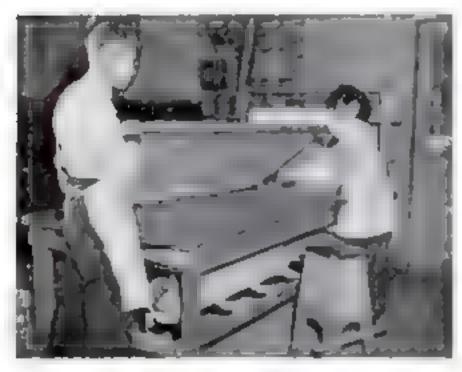

The mold, inside its rubber container, is then
put in an autoclave, an oven providing temperatures
of 280 degrees F., pressures of 63 lbs per sq. in.

he strengthening phonograph records, and as an ingredient of paint to improve its sound-deadening qualities. It is even being used in yarn form by dentists to fill the root canals of teeth. Surgeons also are turning to glass yarn and cloth for sutures, special bandages and filters for blood plasma.

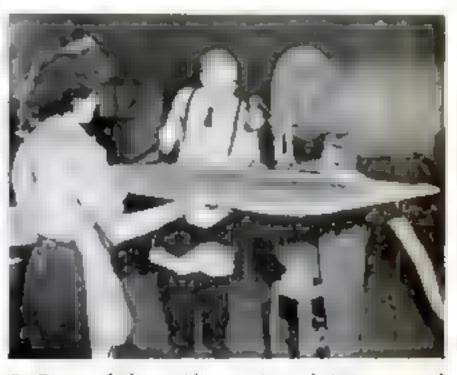

In the future it may even be possible to fertilize your garden by sprinkling the ground with glass wool. In an experimental process being developed by Drs. Alfred E. Badger and Roger H. Bray at the University of Illmois, a special glass containing the principal plant foods is so mixed that it is soluble in water and dissolves slowly in the soil, giving off chemicals necessary for plant life. By altering the composition of the glass, the rate at which it dissolves can be controlled. In this way, one application of the glass fertilizer can be made to serve over a period of several years.

Science has not only learned how to do new things with new glass, but it has learned how, by the use of special coatings, to improve the older conventional forms of glass. One is the new transparent and durable electricity-conducting coating that can be applied to windshields of airplanes and automobiles to eliminate the dangers of icing and fogging (PSM, Oct. '46, p. 92).

Uncle Sam now leads the world in glass technology. Even in the field of optical glass, long dominated by Germany, we now excel, according to the Bureau of Standards. As research continues, the miracle of glass will continue to unfold. Glass as a material is thousands of years old. But glass as an industry is just coming of age.

 After ouring, the glass-cloth mold is removed from the autoclave, taken off its wooden form, and finished with a coat of thermosetting varnish.

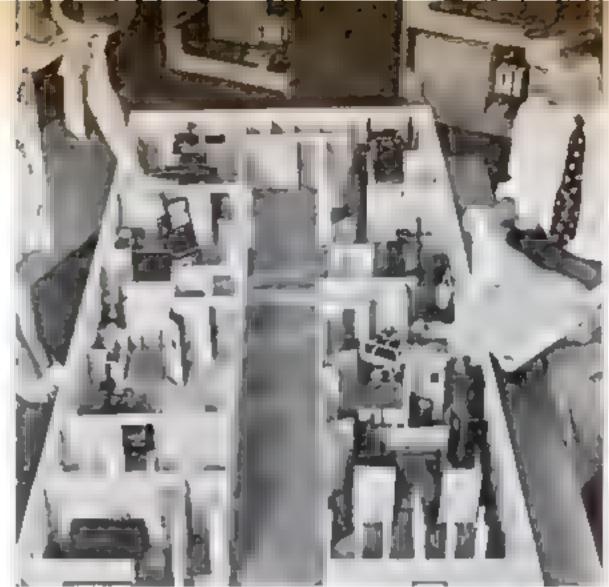

Edges of the motd are trimmed, just as metal would be handled, in the final step. Molds like this speed rubber processing as much as 90 percent.

X-Ray Model. This replies of a hospital wing (right) helps Westinghouse plan replacement of X-ray facilities worn out during the war Such three-dimensional models replace blueprints.

Mine Dress. For miners' safety, the U. S. Bureau of Mines recommends the out-fit above. It includes shoes with reinforced toes, coveralls tied at the ankle, a feather-light dust mask, shatter-proof eyeglasses and a helmet that withstands a 500-pound blow. The respirator at the belt allows normal breathing for an hour if a miner is cut off from air

Leak Detector. A leak detector that can spot a leak small enough to let only a gallon of air out of a container in 60,000 years has been perfected by General Electric. The lad below is trying it on his balloon. The detector tests electronic tubes for vacuum tightness.

138 SCIENCE

GLIDER pilots know that one sure way to locate a rising current of warm air is to find the nearest buzzard and then fly formation with it. The buzzard, an ace among soarers, always knows where the invisible thermals are.

To learn how buzzards know where to fly, Dr. August Raspet, of Locust Valley, L. I., the Soaring Society of America's research director, has invented a one-ounce barograph. The barograph, two inches long and one inch wide, will be strapped to a tame buzzard's breast and will record altitude variations as far up as 3,000 feet.

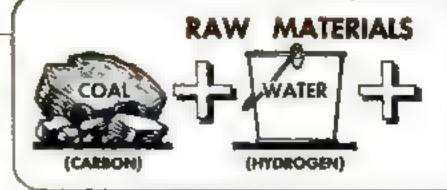

Like the two-to-three-pound barographs that gliders and P-61s carned into thunder-storms over Florida last summer (PSM, Oct. '46, p. 94), Dr. Raspet's model is an aneroid barometer. Changes in pressure (the result of altitude variations) move a stylus over the smoked rim of a recorder drum driven by a wrist-watch mechanism.

When the buzzard soars with its meter, Dr. Raspet will get an accurate picture of "thermal microstructure"—the composition of individual warm-air currents. A buzzard named Files was ready to wear Dr. Raspet's microbard with but died from swallowing a bone between the instrument was completed. George I Carrie of Kendallville, Ind., captured the bird when it was only a few weeks old. He kept it in his cellar until its wing span reached five and a half feet

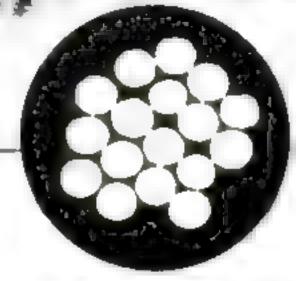

When the captive buzzard first took to the air it was unaware of the effects of wind on flight. It tried to land downwind on a telephone-pole crossbar and ended up hanging by its claws, flapping furiously. The buzzard knew nothing about soaring, either, until one day it blundered into the traffic pattern of some wild buzzards and learned about thermals from them.

Carter is hunting another fledgling that he can train to wear Dr. Raspet's barograph. He even hopes to teach it to fly in a wind tunnel where, by inclining the tunnel and regulating the flow of the air stream, the buzzard's sinking speed can be calculated. Then the bird's flight can be followed through a theodolite and the vertical velocity of a thermal can be measured exactly.

How NYLON Varn is Made

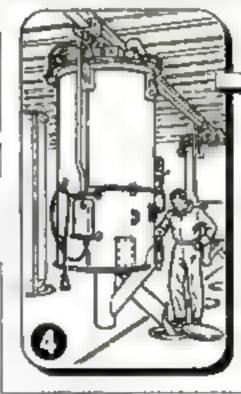

This photomicrograph, taken at a magnification of 660, shows the cross section of a nylon thread. The 17 filoments form a strand used in sheer stockings.

NYLON, silk's young but overwhelming rival, is spun out of air, water and coal. The drawings at the right take the raw materials through the process that chemists worked out in the 1930s to produce the tough, lustrous thread.

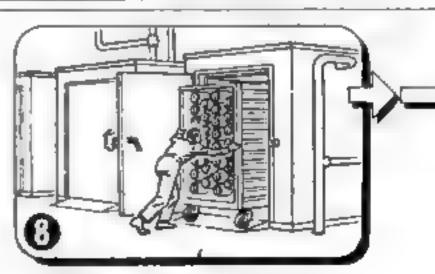

About 90 percent of this yarn is used today in the manufacture of women's stockings. The first nylon hosiery appeared in the stores on May 15, 1940; to date, the supply has never equaled the demand. During the war all nylon yarn was allocated to the armed services, largely for use in the manufacture of parachutes. Du Pont now plans to deliver up to 23,000,000 pounds of the thread annually, enough to make 450,000,000 pairs of women's stockings.

As many as 32 pairs of nylon stockings are knit simultaneously on machines 40 feet long. Gauge, or sheerness, is determined by the number of needles per inch and a half on the knitting needle bar—51 needles make a 51-gauge stocking.

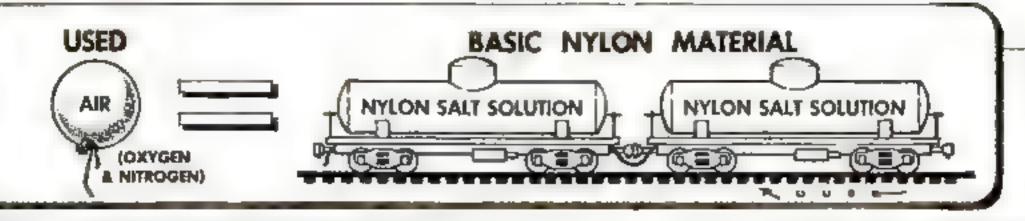

In these great vessels the nylon solt solution, composed of cool, air and water, is evaporated until almost all of the moisture has been removed.

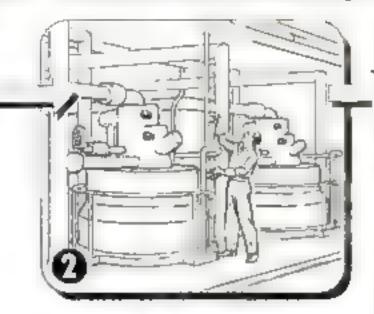

from the chopper, the flaked polymer goes to a blending machine, which thoroughly mixes it with polymer from other costing wheels to give the product uniformity.

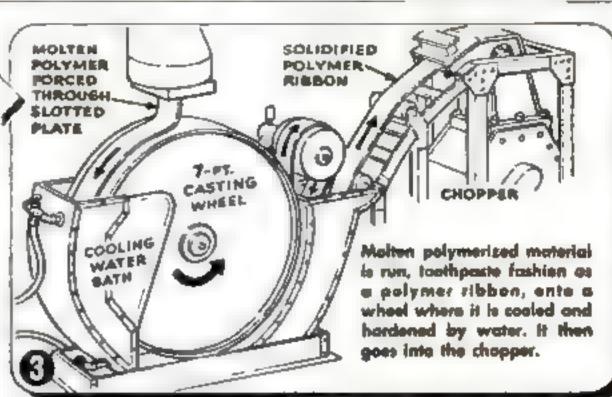

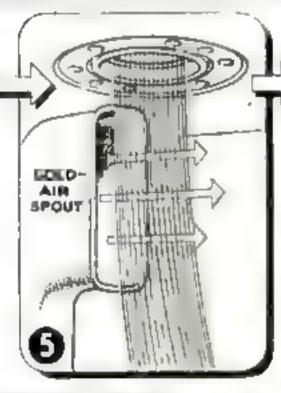

Bobbins are put into trucks and baked in the nylon yarn "twist-setting" ovens before the yarn is wound an speak and cones.

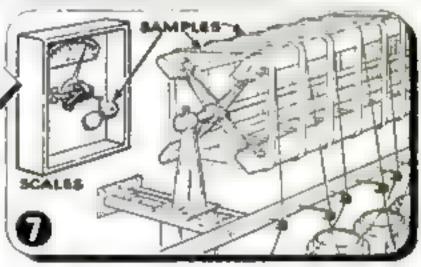

These vats polymerize the materlal at high temperatures, making the small molecules join to form "long-chain" molecules.

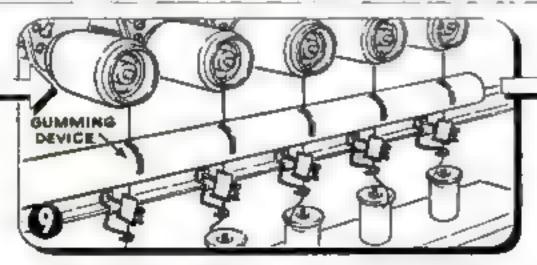

HYLON FILAMENTS O HYLON YARN (ENLARGED)

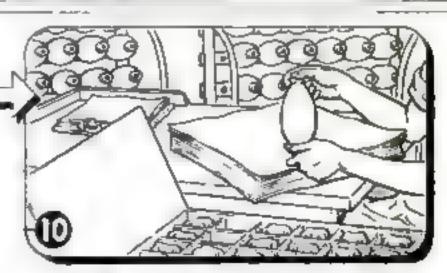

After the blended polymer is melted again, it is forced through tiny holes in a metal plate (left) to make nylon filoments (above). These harden immediately in gool air and are then spun on spinning machines to make nylon yarn.

Sample of yarn of predetermined length is taken from each babbin and weighed to determine yarn's "denier," or size. This sample is clopped off at the real. Thus the babbin can be classified for nylan's thickness.

The thread is wound from one spool to another, passing through a mechanism which applies a gummy substance. This protects the years while it is being knot into stockings or nylon fabrics.

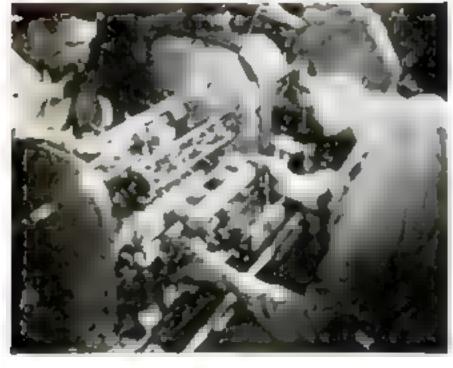

The mills require that each spool or bobbin of nylon thread be carefully inspected and found in flawless condition before it is packaged for shipping to knitters.

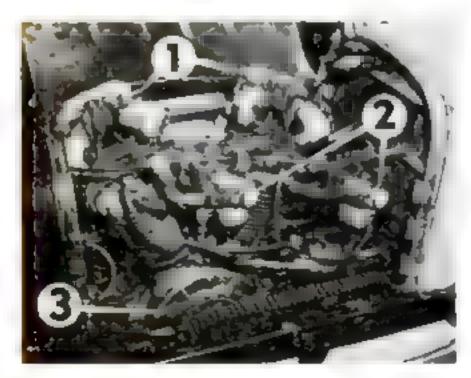

A midget's cockpit is a shoehorn fit. Indicated are: (1) steering mechanism gear box; (2) button to stop engine in an emergency; (3) hand brake; (4) hand oil-pressure pump; (5) radius rad aligning axle and frame; (6) gear shift.

Speeding Up 1984 The Roaring Beetles

Most popular and successful engine for midget racers is the Offenhauser, which costs up to \$2,000. The photo above shows the unconventional but easily accessible twin cam towers that operate the power plant's overhead valves.

Every type of power plant—from converted outboards to souped-up motorcycle engines—is used in midgets. This made-over motorcycle engine shows: {1} housings for valve mechanisms; [2} twin carburetors; (3) crankcase with chain drive.

How the midget racers are tuned to win

RAZZLE-DAZZLE and rough, midget auto racing is winding up its first postwar East Coast season with important money in its pocket to testify to its success as a crowd pleaser. On 20 eastern tracks the noisy sport drew throngs approaching 200,000 a night, and some 250 drivers are now on their way to tracks in the south and west.

Midgets race on tracks a quarter or a fifth of a mile around. Some crack drivers earn as much as \$10,000 a season—in 1941, one cleaned up \$23,000 in 14 weeks. The average midget weighs about 850 pounds and has a 74"-78" wheelbase. Accidents are plentiful, but more spectacular than lethal—the midgets and their drivers are tough.

Here is how a Ford V-8 is converted into a package compact anough to fit a midget. "Cold" spark plugs are used on such engines when they are new but are replaced by "hot" ones as wear develops, Midgets have made 125 m.p.h. on a straightaway.

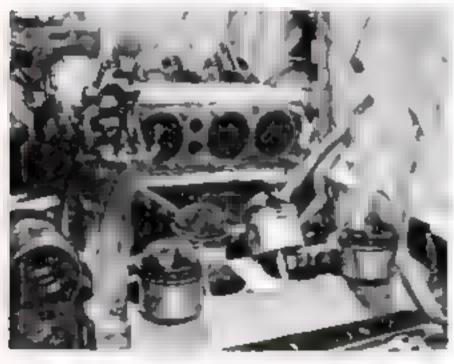

134 SCIENCE

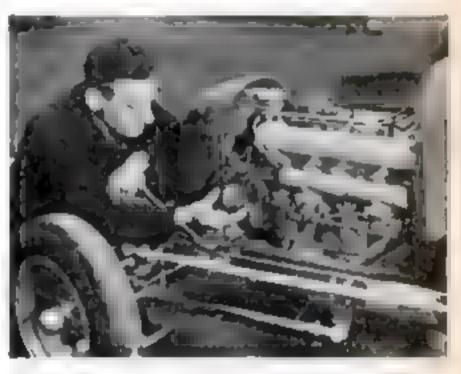

Gear ratio between crankshaft and wheels can be changed an most racers in 15 minutes. Here the assembly is exposed by removing only four balts. Most drivers are shilted mechanics and spend considerable time keeping cars tuned up

Here the gear ratio is changed on a Ford-powered racer. Good "beetles" cast around \$6,000 even though largely assembled from parts out of junk yards or home machine shops. Their drivers are seldom seriously hurt, though accidents are frequent.

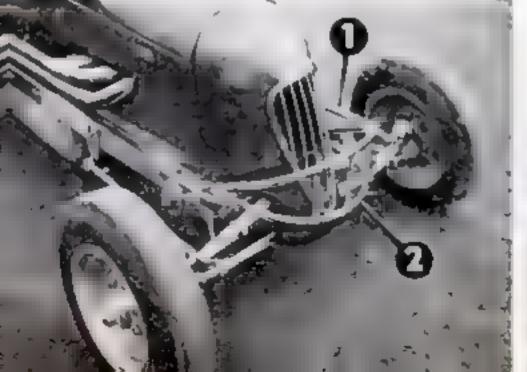

An Offenhauser, above, has rounded piston heads that boost turbulence and combustion. The compression ratio is 14 to 1. Piston displacement is limited to 140 cu. in. for flathead engines, 105 cu. in. for overheads, 65 cu. in. for outboards.

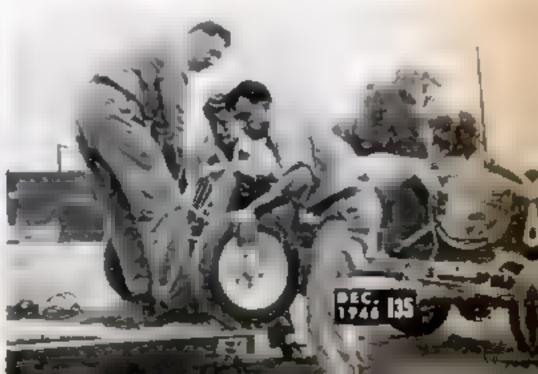

Walter Gerner, a midget awner, checks a distributor cap. Many drivers do not awn machines but race for a percentage of winnings. Eastern owners and drivers pay dues to American Race Drivers' Club or American Racing Association.

Front end of midget shows: (1) special steering rad* (2) bumper. Car's right tire is larger than left one for stability on turns. Tires are beveled an edge apposite direction of turn to hold them an rims. Track speeds seldom exceed 70 m.p.h

With a meet over, driver and crew haul their tiny breadwinner to the next speedway on two-wheeled trailers. Same drivers race as often as five days a week. The payoff is for speed, and the midgets grow faster and faster year by year.

INDUCING SLEEP through mental suggestion is the aim of a special record created and recorded by Ralph Slater, a hypnotist. Entitled "Time to Sleep," the 12" unbreakable record is produced by the De Luxe Record Company, of Linden, N. J. One side is devoted chiefly to an explanation of what the record is intended to accomplish; the other, carrying the voice of the hypnotist with an accompaniment of soft music, gets down to the job of creating a state of mind that will help the listener go to sleep.

A CHRISTMAS-TREE stand distributed by Bradley, Laurens & Campbell, New York, adjusts itself automatically. When the butt is placed in the funnel-like base, the weight of the tree actuates clamps that grip the trunk.

NO SPRINGS, A postal scale made by Buddy Mfg. Co., St. Louis, gives a reading when the disk is swung upward by the weight of a letter or a package hung on the off-center lever.

STERILIZED NIPPLES stay that way when placed on the bottle with the gadget illustrated below. Produced by I. B. Klemert Rubber Co., New York, it consists of a cir-

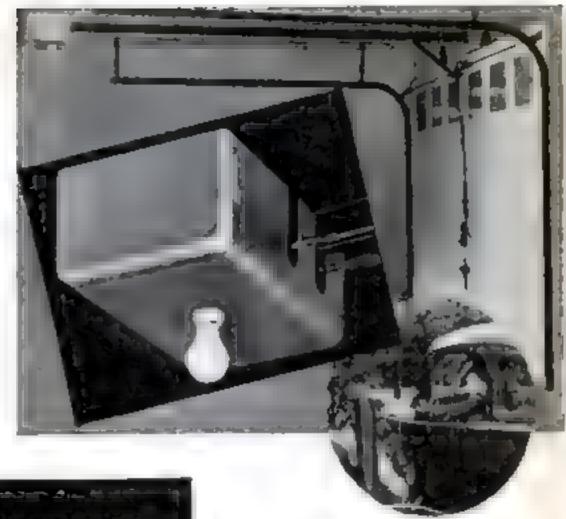

cular aluminum frame with three compressible prongs that slip inside the nipple. As the frame is pushed over the bottle, the prongs spread the nipple so that it goes on easily.

GARAGE DOORS of the overhead type can be unlocked and opened without leaving the driver's seat by installing a "Drivhite-In" made by the Era Meter Company, Chicago, It consists of an electrical mechanism in the garige conjected to a keyoperated switch on a post beside the driveway within arm's reach of the car. The system also works in reverse to close the door after you have taken out the car. As an additional convenience, a garage light turns on when the doors open and turns off when they close. A control also is located inside.

condensed with a device distributed by Bernard Paul & Co., Berkeley, Cahf. When milk is needed the opener-scaler may be raised as above to period pouring. Allowed to go down, it seals the can.

ONE-HAND OPERATION makes this flour sifter a kitchen conventience. A product of the Foley Mig. Co., Minneapolis, Minn., it has a tapering bottom to prevent flour from spilling outside the measuring cup as it is being sifted.

THIS PLASTIC FRAME expands or contracts to fit any picture between 4" by 5" and 8" by 10", and concealed springs hold it rigid at any size. Barrett Plastic Products, Inc., makes it in a variety of colors. It can be set on an accompanying easel or hung from a hook on a wall.

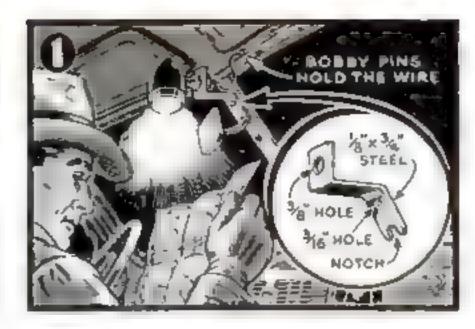

AUTO

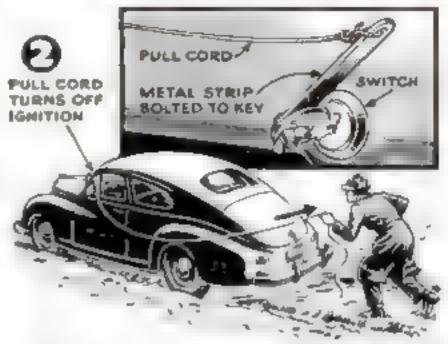

I LIGHT UP FRONT for reading road maps and the like can be supplied by an inexpensive parking lamp mounted on a bracket above the rear-view mirror and connected to the car wiring system. A toggle switch should be wired in the circuit.—W. D. S.

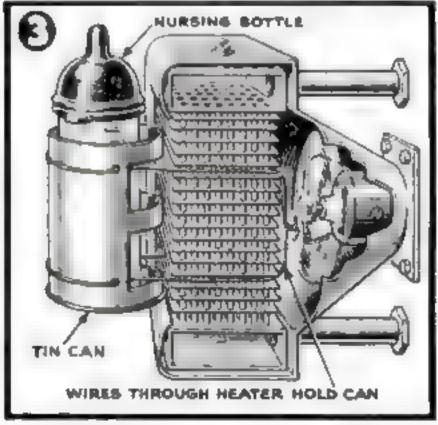

2 REMOTE IGNITION CONTROL is an important safeguard if you push a stuck car. Use a metal strip bolted to the key and attached to a cord that can be pulled to turn the switch off. Then, when you're alone and stuck in slush or mud, you can push the car yourself with the motor in low gear and still turn off the ignition instantly.—H. K. F.

3 HEATING A BABY'S MILK while on a motor trip can be simplified by wiring a bottle holder to the car heater. Use a tin can to hold the bottle and cut out part of one side to admit heat. Run wires through holes and around the top and bottom and then through fins of the heater, twisting them together at the back—C. W. N.

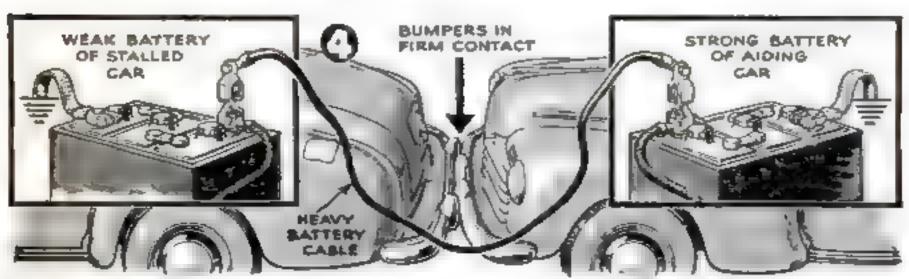

4 BOOSTING A WEAK BATTERY with current from a strong one is a trick performed with a length of heavy battery cable and two heavy-duty spring clips. Place the bumpers in firm contact for a common ground and attach the cable to the ungrounded terminals. The engine of the car with the strong battery should be kept ranning at a good charging speed. Make sure that the grounded sides of both batteries are of the same polarity.—J. H. D.

Drawings by STEWART ROUSE

Gus Beats the Clock by Two Cylinders

By MARTIN BUNN

WITHOUT warning the street door to the Model Garage office was thrust open and a breathless voice shouted: "Where is everybody? Can I use the phone?"

Gus Wilson looked up from the car he was working on and into the office through

the open shop door.

"Sure," he told the newcomer, a young man in a brand-new conservative gray suit, and he put down his wrench and walked into the office, wiping his hands on a piece of waste.

Joe Clark had knocked off an hour early that afternoon, and Gus was keeping his eye on his partner's office while finishing up a job on the shop floor. The young man, obviously a veteran even without the discharge button in his lapel, had already given a number down in the city and was nervously watching the clock on the office wall.

"That you, Mr. Beldon?" he said anxiously into the phone. "This is Clyde-Roger Clyde... Yes-yes, I'm on my way, but I'm having-I mean, something came up

that delayed me . . . What's that?"

His face lost all remnants of its ruddy outdoor glow, and beads of perspiration

broke out on his forehead.

"But you can't do that!" he pleaded.
"You promised . . . Well, I'll make it."

He hung up the phone with a look of

almost desperate determination on his face.

"Know the Riverside Apartments in the city?" he asked Gus. "I've got to be there in exactly 45 minutes, and you've got to get me there!"

"Why me?" Gus wanted to know. "You've got a car. I hear its motor running outside. You can easily drive it in a half hour."

"But you don't understand," retorted Clyde. "Two cylinders are missing . . ."

"So what?" Gus cut in. "Even with two cylinders missing, you can make it."

"Don't argue with me," Clyde shouted.

"I want it hitting on all eight."

Gus began to suspect that his visitor was AWOL from some psychiatric ward. "Take it easy, son," he said soothingly. "I'll be glad to help you, but . . ."

"Quit stalling," the man said and dragged him outside. "There can't be anything seri-

ous. The car's just out of the shop,"

Gus listened to the motor of the sedan. "Two cylinders are missing, all right," he agreed. "When did you lose them?"

"What difference does it make when I lost them?" Clyde returned. "Do something!"

Gus is usually even-tempered, but he decided the time had come for plain talk.

"Look here," he said. "If I do this job, I'll do it my way. There isn't time to check your engine, so answer my questions or take

the car somewhere else."

Clyde tried to smile. "You're right," he admitted. "I've come from Hilton just after having the motor overhauled. The car ran fine for about 10 miles, and then began to miss. First it hit on seven cylinders; then on only six. I stopped at the first garage, and the mechanic put in new spark plugs. Everything was fine again—for another 10 miles. Then the motor began hitting on only six again. At the next garage, the mechanic tested all the plugs and the ignition wiring, and finally decided there was dirt in the carburetor."

Clyde paused to catch his breath.

"He charged me plenty for cleaning and

adjusting the carburetor-and what was the result? Here I am, and on six again."

He looked at his watch. "Man, we're wast-

ing time!" he yelled. "Get busy!"

"O.K.," Gus told him and lifted the hood. For thirty seconds he peered beneath it. "Stan," he called in to the Model Garage grease monkey, "get me some tape."

Even as he did invsterious things with the tape, the rough-running engine settled to a smooth pac. Cas straightened and

dropped the hood back in place.

"All right, mister, there are your eight cylinders," he grinned. "That's 50 cents—and you've still time to get to the Riverside."

"No, you don't," Clyde told him. "Those other fellows fixed it so it ran all right for a while. You're coming with me in case it starts missing again."

"Say, what is this?" Gus de-

manded,

"It's a a matter of life and death, almost," Clyde pleaded. "Please come."

Gus knew he shouldn't, but he felt sorry for the young fellow and agreed. He told Stan to look after the shop.

"I'll drive my own bus," he said. "You follow. I know a short cut, and I know the cops."

Ordinarily Gus Wilson doesn't drive fast, but when he wants to get some place in a hurry, he can do it. When he pulled up at the Riverside with young Clyde just behind him, they had two minutes to spare.

A fat man was standing on the sidewalk with a dozen or more people grouped around him—all with that same harned, anxious

look that had been Clyde's.

The fat man looked at his watch as Clyde

got out of the car.

"You cut it pretty close," he said. "That the car?" And he got in and drove away.

Gus, looking at the disappointed faces in the crowd, couldn't hold in any longer.

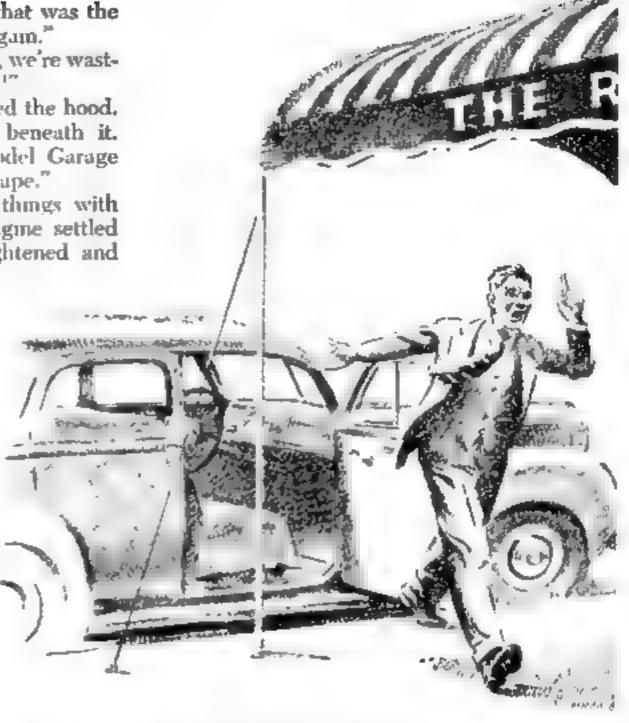

"What is this, anyway?" he asked.

"Beldon's got an apartment he's going to sublet to me in return for selling hun my car," Clyde told him. But the relief on his face gave way to anxiety again, and he muttered: "I hope it doesn't start missing."

"It won't," Gus assured him. "But what's

this apartment deal?"

"Beldon and I are salesmen for the same

The fat man looked at his watch as Clyde gat out of the car. "You cut it pretty close," he said.

company," Clyde explained. "I'm being transferred from Hilton to the city, where I don't need a car, and Beldon is being transferred upstate where he does need one. I offered to sell him my car in exchange for his apartment. But he's a tough customer, and he'd give me only until 5.30 this afternoon to deliver the car. If I hadn't shown up, he'd have traded with one of these other people."

"Now I see," Gus laughed, "I knew cars were hard to get because I'm sort of in the car business, but I never dreamed the hous-

ing shortage was this bad."

Beldon drove back in Clyde's car and got out. "Sorry, folks," he called to the crowd. "Clyde here has a priority on my apartment, since his car's in good shape. I gave him my word. But if he'd been a minute late—"

"You keep the car, and I'll be down Thursday to take over the apartment and close the deal with you." He looked at his watch. "I've got to catch the six o'clock train back

to Hilton. Will you drive me to the station, Mr. Wilson?"

They climbed into Gus's old but well-kept coupe, and Clyde asked what he owed. Gus added the time for the trip to the original 50 cents and pocketed the money.

"It's Beldon's worry now," Clyde said as they neared the station, "but what was the matter with the car?"

"Oh, nothing much," Gus laughed. "The mechanic who overhauled your engine was careless in replacing the hose that feeds hot water to the heater. In your car it passes straight over the engine and, as soon as I lifted the hood, I saw it was sagging and touching two spark plugs. Besides, you had just had your engine tuned, the spark plugs were new, and the carburetor had been cleaned, so I was looking for a short."

"But the hose is rubber," Clyde protested, "a nonconductor. It wouldn't short."

"No?" Gus grinned. "But yours must have had a little leak. I felt it, and the outside was wet-and water is a conductor. But taping the hose to a radiator tie rod kept it from sagging onto the spark plugs. That corrected the short."

"But why did it run fine for a few miles each time it was fixed?"

"Oh, those mechanics pushed the hose aside to check the plugs," Gus replied. "But it jogged back again on the road."

They pulled up at the station, and Clyde got out.

"Maybe I ought to tell you, Mr. Wilson," he said hesitatingly. "The real reason I needed that apartment so bad is because I'm going to be married Thursday, the day I'm to transfer to the city, and we would have had to postpone it if we couldn't have found a place to live. Wait until I see Eloise to-night! Won't she be happy!"

By WILLIAM H. CROUSE

Two basic methods are employed in charging an automobile battery. One is the procedure that has been common for years—removal of the battery from the car so that it can be charged for a day or two at a low rate. The other, which is becoming increasingly popular, is the convenient quick-charge method that many garages and service stations now provide.

A quick-charger, usually mounted on wheels so that it can be rolled right up to the car, is capable of delivering up to 100 amperes. This high charging rate brings the battery up to a reasonably charged condition in an hour or less. Because of its speed and because it usually does not involve the inconvenience of taking the battery from the car and installing a rental, quick-

charging is commanding wider and wider acceptance.

Both methods have their place, but quick-charging has certain limitations. Because of the high charging current used—the power involved may be the equivalent of 1 hp.—a great deal of damage can result from improper use of a quick-charger.

To prolong the life of your battery, it is obvious that you should check its condition periodically. This should be done with a hydrometer. But even without a hydrometer you usually can tell when a battery needs recharging, for this shows up in slow cranking and other starting difficulty.

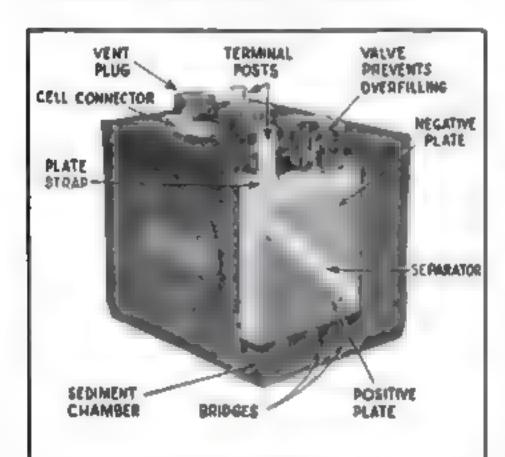

Before a battery is quick-charged (or charged by any method, for that matter) the gravity of each cell should be checked. This will disclose three things, all of which it is well for the motorist to understand before permitting his battery to be placed

on a quick-charger.

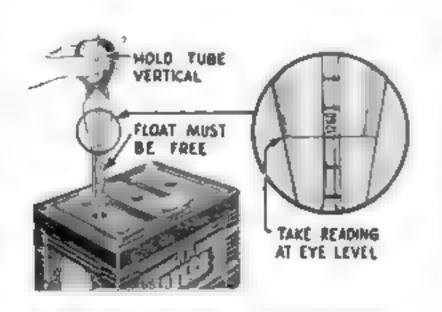

First of all, a hydrometer check will show whether there is enough electrolyte in each cell. If there is too little for a gravity reading, the tops of the plates and separators will be exposed to air, allowing them to dry out and become damaged. In such cases, water should be added before recharging is started.

Secondly, the color of the electrolyte should be noted. If it is discolored with brownish sediment, you will know that the battery plates are shedding active material and the battery is wearing out. Such a battery should be charged by the slow method only—and for the same reason that an older person must avoid violent exercise. Quick-charging is strong medicine and would hasten the death of the battery.

The third thing that the hydrometer test tells you is the gravity of the electrolyte. A

Here is a typical automobile storage battery, the end being aut away to show construction of one cell. How to use a hydrometer is shown below.

reading above 1.250 means it is fully charged; 1.215 to 1.250 that it is only half charged and that it is time for recharging; 1.170 to 1.215, about a quarter charged, and below 1.170 completely discharged. If the gravity readings of the separate cells are more than 25 points apart, you may well suspect that the low cell has an internal defect; for instance, a partial short. A battery in this condition should be slow-charged and carefully watched to see whether the low cell comes up normally. If it does not, you may find it possible to have the cell repaired or replaced.

A further check of the comparative condition of the cells can be made by testing the cell voltages after a battery has been on charge for a few minutes. If one reading proves to be more than .2 volt lower than the others, stop the charging, for the low cell probably is shorted internally. Here again, repair may enable you to get additional service from the battery if the condi-

tion is not too bad.

If the electrolyte looks clear and gravity readings are fairly uniform, it is safe to quick-charge the battery. But there is one final caution, Battery electrolyte temperature must never be allowed to go above 125 deg. F., for high temperature and high charging rate together add up to irreparable damage.

Sometimes a service-station attendant will try to gauge temperature during the charge by feeling the battery case. This is wholly unreliable since the case is an effective insulator. Heat created inside the battery by the charging process will not warm the outside immediately and it is possible, particularly during quick-charging, for the electrolyte to reach a ruinously high temperature long before the case itself begins to feel warm. The only way to check the temperature is by use of a bulb thermometer. Insert it in the center cell and make sure the bulb is covered with electrolyte when the reading is taken.

In connection with battery charging, you sometimes may see advertised or be offered chemical substances or powders that are supposed to speed up the process, or even do the entire job of recharging. The American Association of Battery Manufacturers (which includes all major battery makers) and the U.S. Bureau of Standards have found that such materials do no good and very likely will ruin the battery. Hence, it is best to avoid use of all such substances.

Four infrared lamps in a pit keep warm the underfloor engine of a bus left in the open in cold weather.

RLECTRIC HEATERS End Cold-Weather Starting Troubles

FORTY-MILE wind is rocking the garage, and the temperature is diving toward zero. It'll be much colder by morning You pick up an electric cord, plug one end into a socket concealed in a louver of the car hood, and flip a switch. Then you lock up the garage and go into the house for dinner, secure in the knowledge that in the morning the engine will start almost the moment you touch the starter button.

That's a preview of the application of electric immersion heaters to passenger cars stored in unheated garages. The method has already been tested and found efficient and economical with commercial vehicles. A different way of achieving the same effectwith a bank of infrared bulbs placed beneath the vehicle to throw heat up against the oil pan—has also given promising results.

Immersion heaters were tested several years ago by the Atlantic Refining Company, which maintains a considerable fleet of trucks not stored in heated garages. According to Emil P. Gohn, engineer for the company, the heaters have thoroughly proved their worth. Kept outside overnight in nearzero weather, the unheated engme of a heavy truck might not even turn over in the morning, despite a fully charged battery. With a 500- or 750-watt heater installed in the water jacket, the engine would under the same conditions respond with a quick and reliable start. Best results were achieved when the cylinder-wall temperature was brought to approximately 45 deg. F If the temperature was raised somewhat less, say to 35 deg. starting time was almost tripled.

What's the cause of hard cold-weather

starting? Improper handling of the controls, an inefficient ignition system, or an incorrectly adjusted carburetor are all possible troublemakers. But the basic difficulty springs from the cold itself. Thick, sluggish oil on the cylinder walls and in the bearings imposes an enormous current drain on the battery (itself less efficient in cold weather); the engine is thus cranked over very slowly and the ignition system is starved of the voltage it needs to deliver a hot spark. At the same time the ice-cold carburetor and intake manifold impair fuel vaporization.

With an immersion heater at work to keep the engine's blood warm, chances of starting failure are greatly lessened. Cylinder walls, bearings, and lubricant are ready for use. The starting motor can spin the crankshaft at almost normal speed, and the spark coil isn't deprived of its share of current. Enough warmth has been conducted to the intake manifold and carburetor to take the chill off the surfaces the vaporized fuel-air charge will touch. Hence the probability of a fast start is greatly increased. But water-jacket heaters aren't a sure-cure panacea-faulty starting technique, or poor condition of the ignition or fuel systems, can still mean a dead battery and a silent engine.

An immersion heater, usually a coppersheathed, watertight cylinder containing a length of resistance wire, should be mounted as low as possible in the cooling system, and should be located so that the heat is concentrated in the engine block rather than the radiator. One or more line thermostats in the hose or hoses leading to the lower radiator tank keep the warmed antifreeze solution from circulating through the radiator, with resultant heat loss. While installations can be made in the lower hose connection, or (preferably) in the lower inlet elbow of the block, the ideal place for the unit is within the block itself. This would of course generally require that blocks be designed for the purpose.

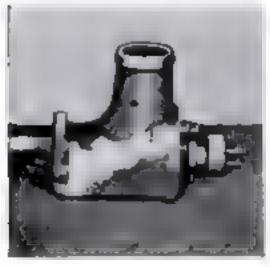

Engineers estimate that for the average light car a 200- or 250-watt heater would be ample. Though a night-long current drain of this size may not seem economical, proponents of immersion heaters point out that heating an entire garage by conventional means is hardly cheap, and that the savings on battery-charging and tow-starting fees can be considerable. Because the already warm engine doesn't have to pass through the dangerous, high-wear time when the engine has started but the lubricant isn't flowing right, the heaters probably also save money on major repair bills,

Compelled by a shortage of garage space to keep many of its buses in the open, the Philadelphia Transportation Company turned to the use of familiar infrared heat lamps. Shallow pits were dug under 27 outdoor parking berths, lined with creosoted wood, and fitted out with four 250-watt bulbs apiece. The lamps were placed so that their heat was concentrated on the underfloor engines of the buses.

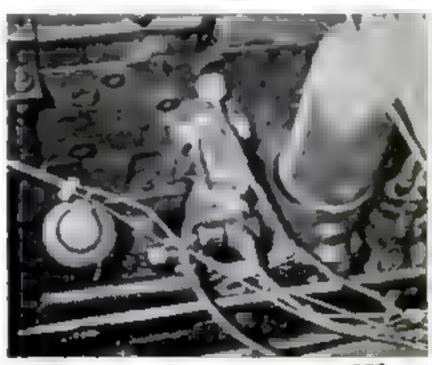

According to R. H. Dalgleish, Jr., an operating executive of the company, the method has shown itself to be both practical and economical at temperatures down to 2 deg. F. He reports that less starting difficulty has been encountered with buses kept warm in this way than with those in garages where the temperatures were 35 or 40 deg.

For the car owner having either an unheated garage or none, electric engine heating has much in its favor. But pending the day when such heaters are built in at the factory, ingenious motorists will have to devise their own equipment.

Here is the immersion heater used in experimental Atlantic Refining installations. Below, two views of the heater itself in the inlet fitting of the cylinder black. The photo at right shows two heater units in place on the engine of a big truck.

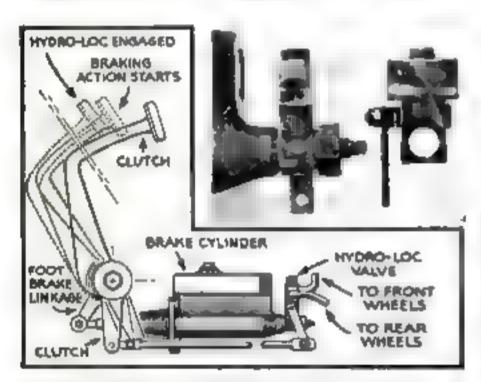

AUTO IDEAS

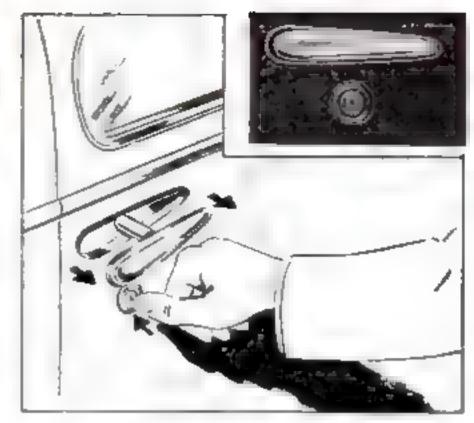

RECESSED DOOR HANDLES that can't catch on clothing are released for turning by pressure on a ring around the lock. Once extended, a handle remains so as long as the door is open. Shutting the door automatically returns it to its recess, flush with the door contour. Opening from inside leaves the door handle recessed. Leonard Manufacturing Co., of Los Angeles, is the maker.

ROLL-BACK ON HILLS as the right foot is shifted from brake to accelerator at starting is prevented by a new hydraulic-brake control made by Hydro-Aire, Incorporated, of Los Angeles. Foot brakes are applied as usual, but the control holds them on until the clutch begins to engage. Ordinary clutch operation is not affected.

PLASTIC REFLECTORS can now be tailored to fit and mounted over nonreflecting road signs, markers, and guard rails, saving the expense of complete replacement. The reflector material consists of tiny glass lenses embedded in flexible both in roll form and lit is a product of the Manufacturing Co., known as Scotchlite.

FILTER EFFICIENCY is indicated visually by the height of the aluminum spool in the glass tube shown below. The attachment, called a Filter-Meter and made by Hunter and Company, of Cleveland, is connected in the oil line to warn when a change of the filter cartridge is necessary.

embedded in flexible plastic and is available both in roll form and in ready-made signs. It is a product of the Minnesota Mining & Manufacturing Co., of St. Paul, and is known as Scotchlite.

CUSHION STOOLS

for EXTRA COMFORT Anywhere

Used singly, cushion stools will seat one or even two persons.

By EDWARD E. THORP

LARGE, square cushion stools that you can make yourself can be a big money saver in your budget for furnishing a small home or apartment. Their advantage over one-purpose pieces is easily apparent.

Placed together in a group of six, they

make a comfortable bed; in threes, they form twin beds; against the wall in a corner, they turn into a corner divan; while for a large gathering each stool becomes a roomy seat for two people, answering the chair problem without the need of in-between storage.

The basic unit is a low stool fitted with a deep, comfortable cushion and nonskid feet. Since each piece is square and the sides are flush with the legs, almost any number of combinations is possible. The 24" width will provide maximum seating space with the least area of

floor space lost to other uses.

Only three sizes of lumber are needed-stock that will finish to 25" by 25" for the legs, %" by 7%" for the sides, and almost any width "" boards for the top. If machine tools are not available for recessing the legs, you can use 13" by 13" stock and build up the bottom section on two sides. Neat joints for such built-up sections call for a miter box, though butt joints will serve if the exposed end grain and joint are filled with a wood filler. For six stools you will need enough stock for 24 legs, 24 sides, and six tops.

Time can be saved if all sides are cut 234" long and all corners assembled alike with the flush board always on the same side. Assemble one board to each leg with glue and nails; then, when

the glue has set, assemble the four sides and legs in standing position on the bench to avoid wobble. The top strips may be put on solid or spaced not more than 1". A 1%" by 2%" cleat put in edgewise across the center will prevent any possible sag. Finish the exposed legs with stain and a good varnish to match the other furniture.

Grouped in double rows of three, six stools become a comfortable double bed, or in single rows of three, the six make twin beds.

FABRIC STITCHED TO MULLIN

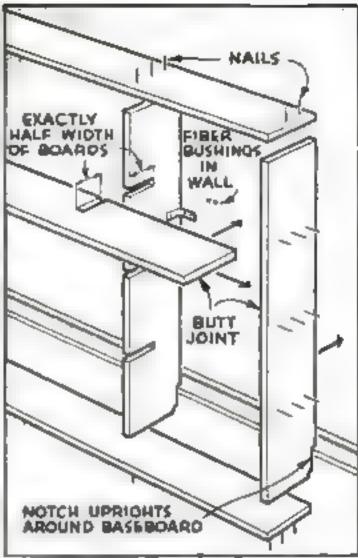

> FABRIC OVER TWO LAYERS OF COTTON

> > TACK TO UNDERSOR

Many furnishing schemes are possible with a set of stools. Here six are used against two walls to form a modern carner divan.

Pad the top with two thicknesses of cotton batting and tack muslin over it. Then tack a 12" strip of upholstering material around the stool by its bottom edge, place two thicknesses of padding all around the sides, and bring up and stitch the upholstery lightly to the muslin Pull out any wrinkles toward the corners and turn them in, and then stitch the upholstery material permanently to the muslin. It can be tacked also if the stools are likely to get rough usage. Muslin may also be stretched across the bottom and tacked under the sides. Inverted rubber easter cups tacked to the feet will keep the pieces from sliding.

Wall-Size Knickknack Shelf Fills Blank Space at End of Room

FACED with a big expanse of bare wall at one end of a sun room, we decided on a knickknack shelf. It had to be wall-size, and it holds those odd pieces that just don't belong anywhere in particular but provide an eye-filling bit of variety.

We built our shelf the hard way, by first nailing in uprights and then toe-nailing in short shelf sections to fit between. It might have been better to notch the uprights and shelves egg-carton style, as in the drawing, or to set the shelves in conventional bookcase dadoes To get the piece flush against the wall, notch the uprights at the bottom to fit over the baseboard. And to keep the whole works from coming down with a crash, screw three or four small angle brackets under the middle shelf where they won't show. Anchor them to the wall with screws set in a stud or in fiber plugs driven into holes in the plaster.

Dimensions are up to you, since it's your wall, but make the shelves wide enough to hold your biggest knickknacks. Boards %" by 5%" should do.—Jean Blackburne.

BOTTOM JOINT

Wastepaper Basket Built on Modern Lines

THOUGH modern in looks, this wastepaper basket is not so extreme that it won't fit in most decorating schemes. Make the sides of thin stock or plywood. Two are square, and the other two are equilateral triangles. They are butt-joined with nails and screws, but the bottom edges of the two square pieces should be mitered for a neat fit. Two feet, also equilateral triangles, are cut from 1" stock. Despite the seemingly narrow base, the basket is quite stable.

The piece may be stained and varnished, given a natural finish with clear varnish and well-rubbed wax, or enameled and decorated with decal transfers.—E. E. T.

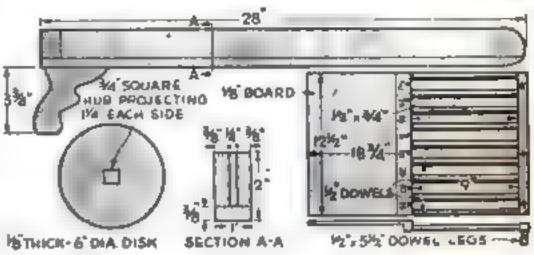

Luck and Skill Needed For Shooting-Disk Game

With a sharp eye and a steady hand you might be able to beat Junior at this made-for-Christmas game that's fun all year 'round The disks are sped by gravity down an inclined gun and roll along the floor to the slotted target. Set the target at one end of the room. About 6' away, rest the end of the gun on the floor at an angle of approximately 35 deg. Then let

each of the three disks roll down the gun. With luck, they will wheel into the slots.

The score is computed from numbers on each slot and on the square hubs that support the disks in the slots. Number each slot in multiples of five, lowest in the center and highest for the edge slots. The sides of

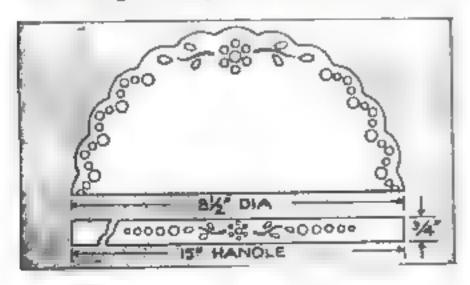

the hubs are numbered 1, 2, 3, and 4. To secure the total score, multiply the uppermost hub number on each disk by the number of its slot, and add together. High man wins. Pressed composition board or plywood, dowels, and scrap wood are needed to make the game.—MYRON FLEISHMAN.

This useful candy and fruit basket sparkles with a flower design made by drilling holes halfway through and coloring the dimples. The pattern is below.

Clear Plastic Candy Basket Decorated with Blind Holes

Colored blind holes provide sparkling decorations for this clear plastic candy or fruit basket, pictured in color on page 117. By drilling halfway through the plastic with different drills, a simple flower design is created. Finishing touches like the stems and leaves are burred on with a hand grinding tool

The basket section is made from an 8%" circle of 8" or 8" clear plastic with scalloped edges. The handle is a 8" by 15" strip of the same material. To apply the coloring, wrap the tip of a round toothpick with cotton. Dip this swab in the color and twist around inside the holes. For this design, the flowers were tinted red, the leaves and stems green, and the edge holes yellow.

Shape the basket by heating in an oven at 250 deg, and bending so that the holes will be on the underside. The two ends with the flower decoration should remain flat. The handle is formed in the same way by heating and bending until its ends fit flat against the sides. Cement in place.—Elma Waltner.

What's New in HOME HEATING

Keeping warm in winter without a fire sounds impossible, but a new system offers just this.

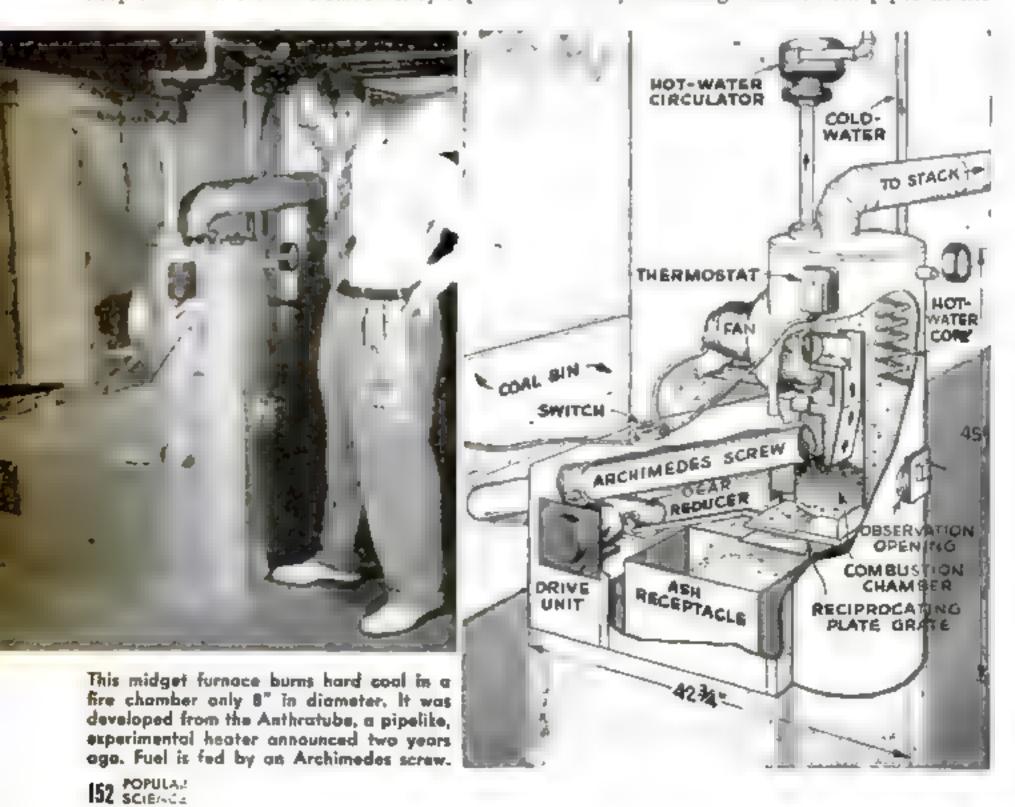

By R. P. STEVENSON

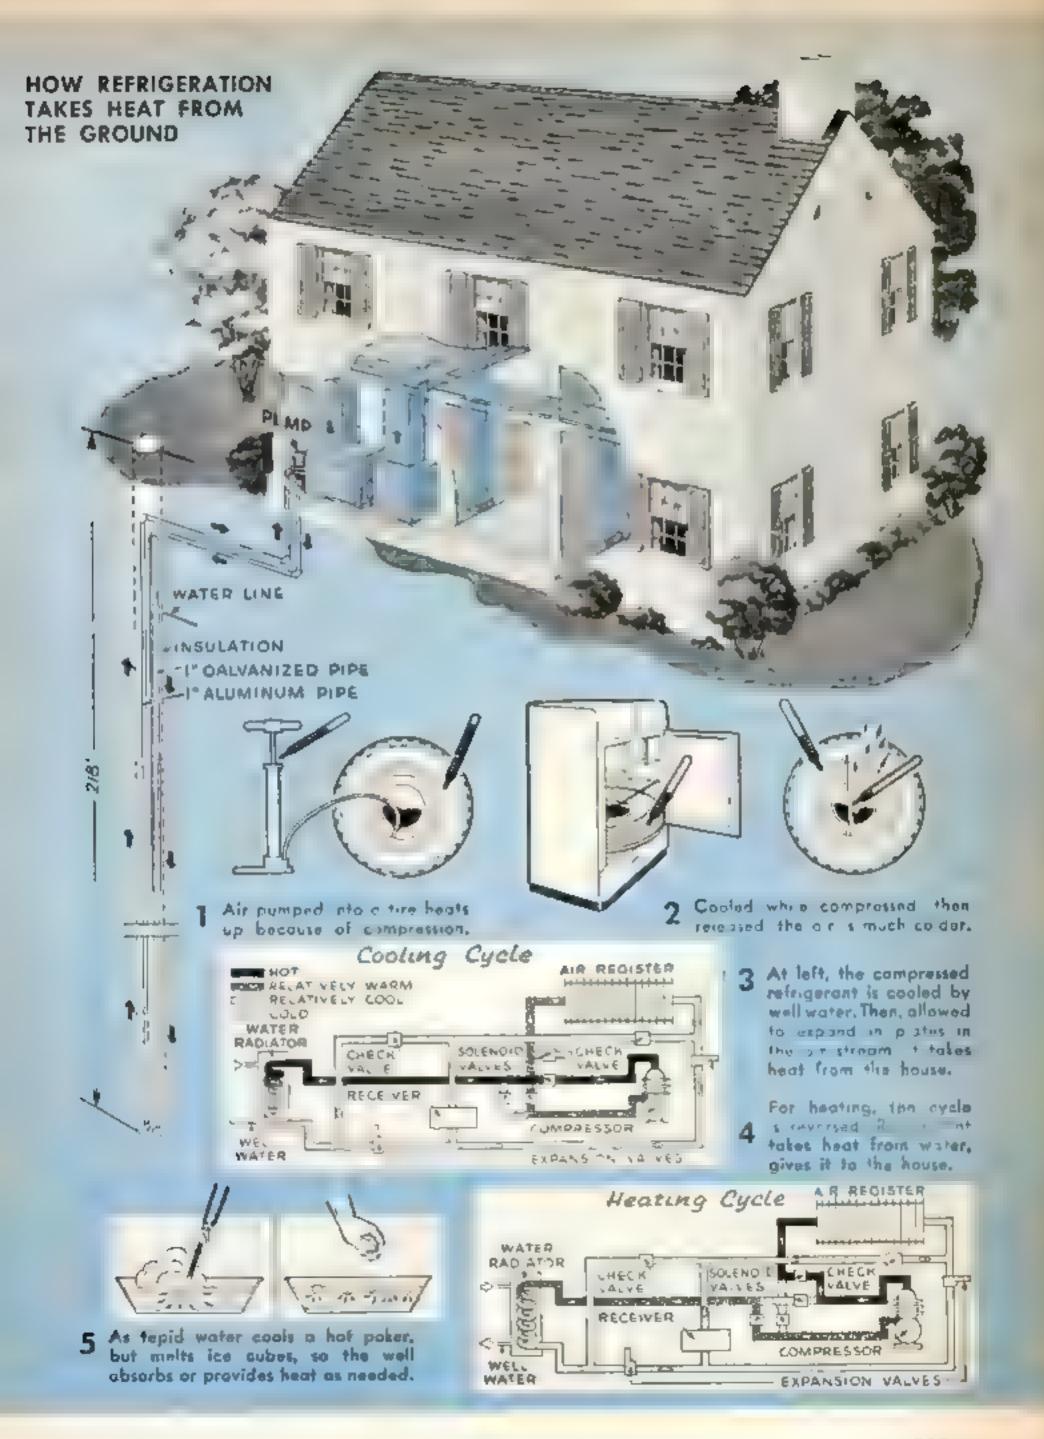

HEATING engineers are giving new meaning to the old expression, "all the comforts of home." It wasn't so long ago that the development of various types of automatic heating began to banish the coal shovel and its attendant drudgery. Now the experts are promising us even more. Before long—as a matter of fact right now if you wish—you'll be able to discard not only your shovel, but the furnace fire itself.

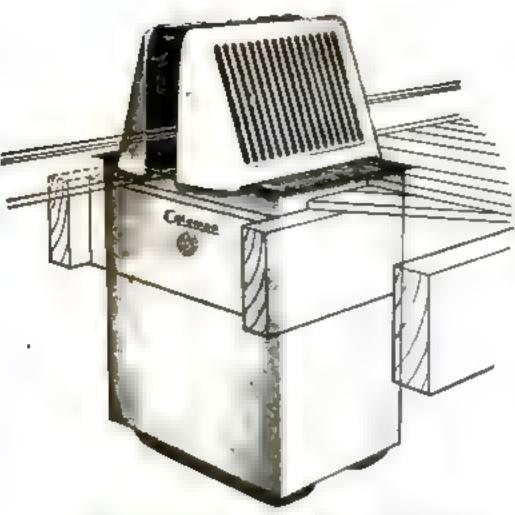

Historically speaking, heating a home without a fire is a major milestone. Always before, we have depended on the combustion of wood, coal, coke, oil, or other fuel to keep us warm. Now we can do it by expend-

ing electrical energy to pump into our homes some of the heat that is always present, winter and summer, deep under the ground. And strangely enough, the apparatus that does the job is little more than your electric refrigerator working in reverse.

Nor is this the only break with tradition in the field of heating. In planning a new home, you can forget about a chimney—at least as a draft-producing device. Several types of furnaces now on the market, or soon to appear, create their own drafts and need only a vent in the wall. Neither do you need a cellar, since a small utility room, or even a closet, provides adequate space for one of the compact new heaters, whatever it burns. And by installing radiant heat pipes in the

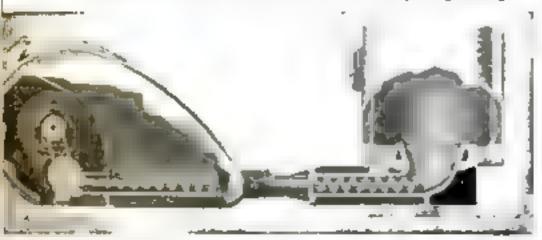

Oil-burning space heaters made by the Coleman Co., Wichita, Kan, are installed under the floor, as seen above and below. A similar heater that burns gas is produced by the Rheem company, New York.

TRUBSCOPINO
LUE CONNECTION BURNER SAFETY CONTROL

Below is a stoker with a single cone-drive gear and pinion designed by the Stoker Drive Company, Frederick, Md., to replace old multiple gearing.

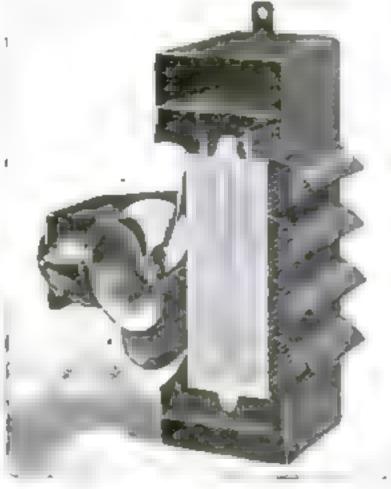

floors or walls, or by using the new radiant baseboards, you can eliminate the old spaceconsuming radiators.

In appearance, the heaters now reaching the market bear little resemblance to the ugly contraptions that have cluttered our cellars for so many years. More compact and better designed, they might well find a place in the living room instead of the cellar. In fact, new fuel-oil space heaters produced by Duo-Therm are based on Chippendale and Hepplewhite furniture designs.

For soft-coal users, new smokeless models are available, making it easier for the housewife to keep the home clean. Those who burn anthracite soon will be able to buy a midget furnace which puts to use a principle announced two years ago by the Anthracite Institute-that more complete combustion and greater heat output can be obtained if hard coal is burned quickly by forced draft in a small combustion chamber. Early experimental models of this compact furnace resembled a length of pipe; hence the name "Anthratube." Improvements in oil burners include a clutch, produced by the Gilbert & Barker Manufacturing Company, West Springfield, Mass., to prevent formation of heat-stealing soot in the fire chamber.

Both gas and electric refrigerators have been adapted to give you heat in winter and air conditioning in summer, the same automatic equipment being used in both sea-

Installed in a wall, the electric heater shown in cross section below has a fam to spread its heat. The resistance is sealed in an aluminum casting. Electromode Corp., of Rochester, N.Y., makes it.

sons. It is an electrical refrigeration system that will enable you to have heat without combustion, the refrigeration cycle being reversed and giving us the designation "reverse cycle heating." It also is called a "heat pump" because heat is transferred from one temperature level to a higher one.

During the past year, a commercial model produced by the Muncie Gear Works, Inc., made its bow in more than 100 homes in Muncie, Indiana, Marketed under the trade name of Marvair, this system is illustrated on page 153. It takes heat from the ground by circulating water in a closed pipe system. placed in a well of 4" or 5" bore drilled to a depth of approximately 200' below the natural water level. Aluminum pipe is used for the return leg because it absorbs heat better. Even in the northern latitudes of the United States, underground temperatures are surprisingly high. For example, around New York and Chicago the temperature is approximately 52 degrees at a depth of 30' to 60'.

The compressor of any refrigerator creates some heat directly, but this should not be mistaken as the source of the heat that warms a home in the reverse-cycle system. The compressor merely lends a helping hand to get heat from the ground.

When the underground heat units contact the cold pipe, they are absorbed by the circulating water. Pumped up the pipe, the

In starting or stopping, most all burners give off a soot-creating puff of smake because enough air for complete combustion is not delivered by the fan. The clutch below is designed to prevent this.

Tor complete combustion is not delivered by the fan. The clutch below is designed to prevent this.

FUEL PUMP

3... BEFORE THE

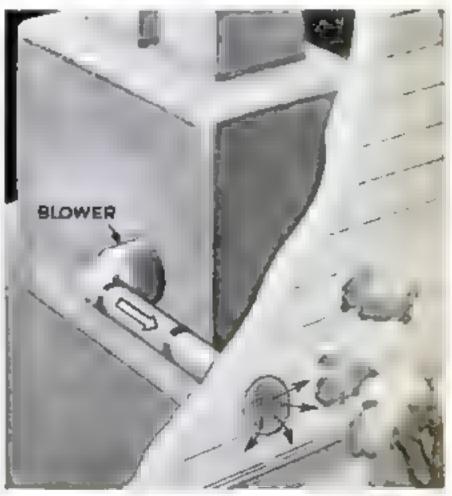

CLUTCH ...

water carries the heat units to a water radiator, where they again contact a colder fluid, this time the refrigerant. As before, the heat units go to the cooler region. Moving on to the compressor, the refrigerant is put under pressure. As in all cases where the pressure of a gas is increased, its temperature also goes up. Now compressed, the refrigerant travels to the air radiator, still carrying the heat that came from the earth. Once again the heat units seek a cooler region, this time an air stream on its way through ordinary ducts to the rooms that are being heated. There, they keep you warm.

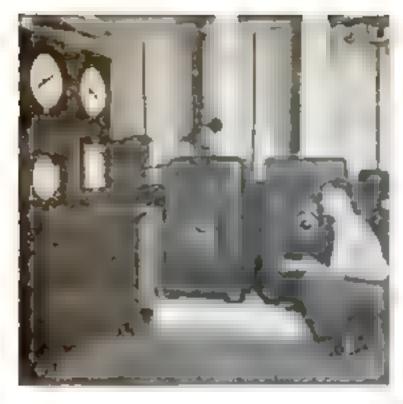

Operated like an ordinary refrigerator, the Marvair system also cools your home. But in this case, the transfer of heat is reversed—from the home to the ground. Automatic controls, including four solenoid valves, make the change from heating to cooling and vice versa as the need arises.

Anyone who has pumped up an automobile tire has observed the generation of heat, usually by feeling how hot the pump hose is. Air in the tire is also hotter than that outside, but if released from the valve, the escaping air is found at its original temperature. Now suppose that the compressed air is first cooled by placing the tire in a huge refrigerator. If you then allowed the air to escape, it would lose the same amount of heat it gained when the tire was pumped up, but since its temperature already is lower, it

Several heaters need only a simple vent instead of a chimney because they create their own droft. One of these is the new Norge oil furnace. It has a fan to pull air through the combustion chamber.

DEC. 155

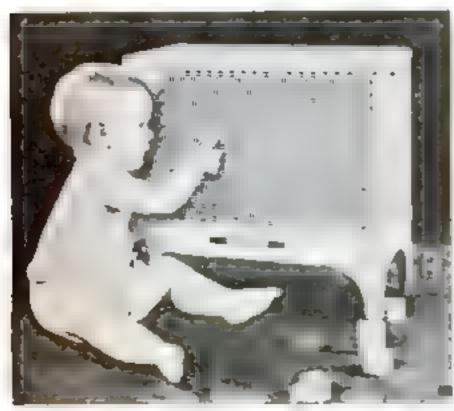

Ordinarity, pot burners require high grade oil because heat from the flame cracks a cheaper grade while it is vaporizing. Socony-Vacuum engineers now have developed a pot-type heater which prevents cracking, making it possible to use the more economical fuel. It is shown above under test and in a cutaway view.

would descend far below the original point.

This illustrates what happens in the cooling cycle of a combination cooling-heating system. The refrigerant, heated by the compressor, passes directly to the water radiator. Since the refrigerant at this point is warmer than the water, it loses heat to the water; that is, the refrigerant is cooled as the air was in the tire example. Consequently, when the refrigerant passes through the expansion valve, it loses the same amount of heat it took on in the compressor but it goes below its original temperature by the same amount it gave up in the water radiator. Continuing on to the air radiator, the refrigerant then extracts heat from air circulating in the home. When the home needs heat, exactly

Designers of portable electric heaters have made them safer. Even a baby faces no danger from this one, made by Trilmont Products Co., Philadelphia.

the reverse occurs, the water giving heat.

Although current models of the Anthratube no longer resemble a length of tubing, the advantage of compactness has been retained. The automatic hot-water unit illustrated on page 152 has a boiler 16" in diameter and 45" high and, with the automatic feed mechanism, the entire furnace occupies a floor area only 20" by 42%".

Combustion takes place in a chamber only 8" in diameter, but the suction draft created by a fan produces an extremely hot fire. Fuel feeds from the bin through an Archimedes screw. Since the coal falls from the screw to the firebed by gravity, feeding stops when the combustion chamber is full—even though the tube continues to turn at its normal rate of about 15 r.p.m. A crank and connecting rod from the reduction gear operate the grate horizontally at the rate of one 2" stroke a minute. This shears off the ash, allowing it to drop into a removable ash receptacle below.

A thermostatic-type switch controls the position of the fire as well as the operation of the fuel and ash-removal mechanisms. Located so that it is sensitive to the temperature of the lower section of the firebed, this bimetal switch turns on the motor, setting the Archimedes screw and grate in operation, when the coal in the bottom of the bed has been consumed and the ash begins to cool. After the ashes have been ejected and hot coals take their place, the increased temperature shuts off the switch and the motor stops. If the fire should go out, another control cuts out the entire mechanism and prevents unburned coal from being wasted.

156 SCIENCE

WHAT'S YOUR INGENUITY QUOTIENT?

MUSIC HAS CHARMS to soothe the restless baby. Mine is apt to wake up crying for reasons that only he understands. A music box under his crib seems to be the perfect pacifier. At the first bellow I turn it on and let the faint tinkle waltz him back to sleep.—James Carpenter.

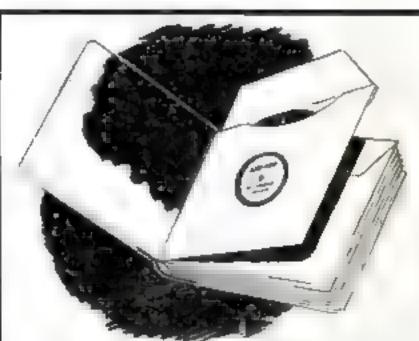

ARE YOU A PIGGY-BANK SHAKER? I can't trust myself when my back is turned, so I bury my loose change in any empty oil can. A length of pipe chutes the coins into the can, and a rubber collar around the opening keeps the ground moisture from seeping in.—George L. Payne, Jr.

Have you pulled off a smart one lately? We will pay for acceptable contributions showing ingenious solutions of problems in the home, shop, garage, or camp. It doesn't matter if it's wacky—if it works.

YOU'RE AT YOUR ROPE'S END when it begins to fray. This brings out the Scotch in me, so I twist the frayed ends tightly and serve them with Scotch tape. In return pieces so salvaged serve me for everything from emergency shoelaces to apron strings.—A. H. Stevens, Jr.

WELL, FLAP ME DOWN! That's the way I felt when I held a phonograph album wrong side up and the records slithered out of their sleeves. Now I've pasted cardboard flaps over the envelopes, so no matter who does what to them, the disks stay put within, snug and safe.—James Roberts.

LACED LEATHER BELT . . . GAUCHO STYLE

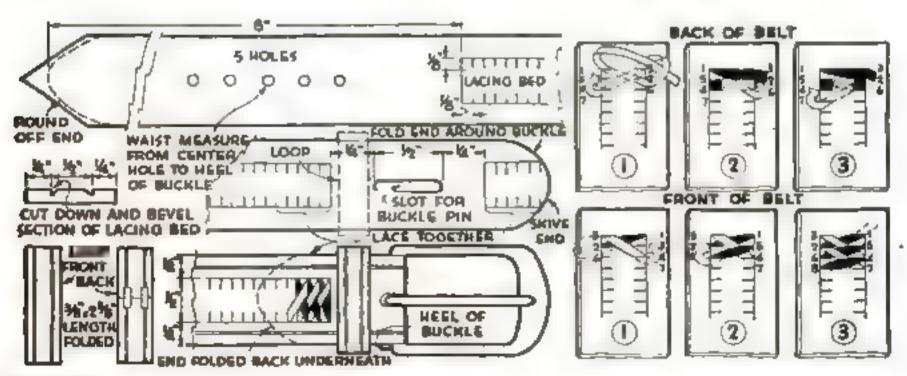

HARD-RIDING gauchos no longer rule the wide Argentine pampas. But the fine leather handicraft developed by these South American cattle punchers has been preserved, unlike the lost craftwork of our own cowboys, in government museums. From examples of their handsome bridles, knife handles, and other gear can be copied details like the typically gaucho "costura" braidwork that decorates the belt above.

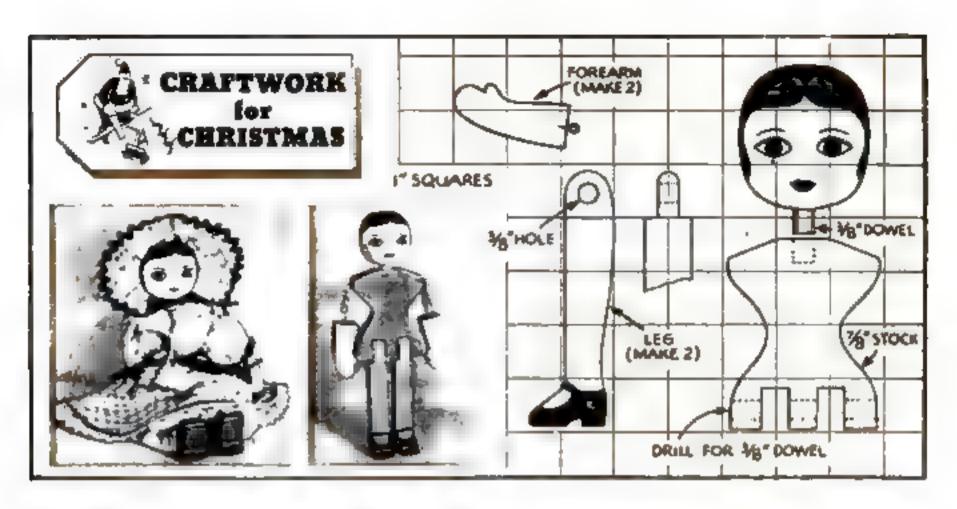

To make this, you will need a piece of belt leather 1" wide and several inches longer than your waist measurement (see drawing), a buckle, and 1 yd. of 3" leather thong for every 3" of braid. The plastic or fiber lacing employed for whistle lanyards might be used in place of leather, and the braidwork could be added to an old belt, if desired. Contrasting colors are most effective; the gauchos themselves preferred

to use white costura applied to a black belt.

Depressing the braid in a "bed" improves the appearance. Dampen the belt, and when it has dried so that no moisture can be squeezed out of it, mark the bed area and cut along the two sides to one third depth. Next bevel inward with a tap beveler. After the belt has thoroughly dried, lay off the holes 5" apart. Punch them with a single-pointed thonging chisel or a nail filed sharp.

Now begin lacing the braid by passing the thong, its point stiffened with glue or held in a lacing needle, through hole number I from the back to the front, and continue through the numbered sequence shown in the drawings. At the buckle end, the braid goes through two pieces of the belt at once to hold on the buckle. Finally, tap down the lacing and finish to a soft sheen with saddle soap.—Bruce Grant,

Wood Doll of Covered-Wagon Days Has Movable Arms and Legs

Quaint wooden dolls whitled painstakingly by fathers and dressed by mothers made many a trip across the plains in the days of the covered wagon. This "modern" old-fashioned miss will be no less cherished by a little girl this Christmas. Instead of being whittled, its body and movable arms and legs can be saved out with power or hand tools; its head is a turning or a wood ball.

Make the parts of hardwood and round the edges. Drill the hips for a hardwood dowel; then round the ends of the legs until they move freely on it in the notches. The forearms hang on stout cord knotted through small screw eyes or held with staples.

Shellae over the wood provides a natural complexion. Paint in features, hair, and shoes with enamel to which a few drops of clear varnish have been added.

The doll wears long pantalettes, the traditional one-piece dress with kinono sleeves, a sash, and a bonnet.—Donis Allen

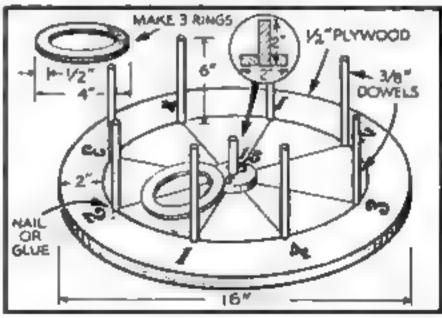

Ring-Toss Game for Table Play

HERE is a ring-and-peg game for indoor play on rainy days. The base is ½" plywood, as is the glued or nailed center disk with the short peg. Mark the base radially and paint the spaces black and light blue alternately; then number the long outer pegs 1 to 4, the disk 5, and the short peg 10. Cut three rings from 14-ply show-eard stock

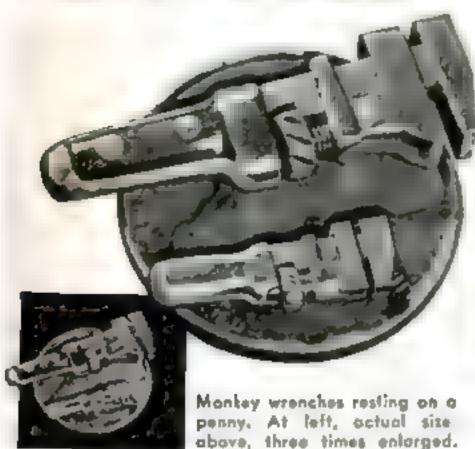

Note that the short peg is driven into a hole in the center of its disk and not into the board itself, while the outer pegs are put in holes drilled in the board.

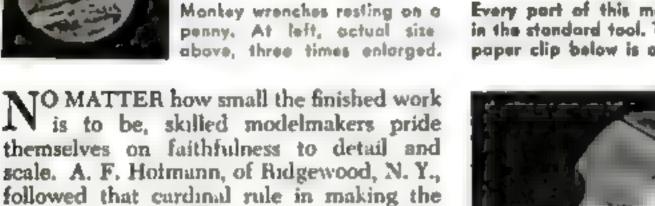

Players stand 4' from the board, and their score is what they ring. When two rings go over one peg, the number counts twice; but if three go over a long peg, the entire score is wiped out. A third ring over the short peg counts. Rings tilted on the center disk without going over the peg count 5; those that fall cleanly around the disk as well as the peg count 15.—Donald W. Clark.

Tom Thumb CRAFTWORK

Most of the vise was made on a miling machine, but a lathe, of course, was required for the screw. Swiveling on its base, the vise can be locked in any position. It

Every part of this model surface gauge works as in the standard tool. The little vise shown holding a paper clip below is only 2%" long.

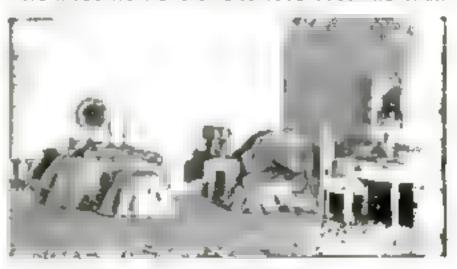

measures only 21/32" by 1 3/16" by 2%".

The model furniture is a size suitable for doll houses. It is made from plywood and other scraps, and the accessories from discarded materials. Though much is copied, the work leaves room for original design.

Model furnishings of doll-house size are faithful copies of antique pieces on a scale of 14" to 1".

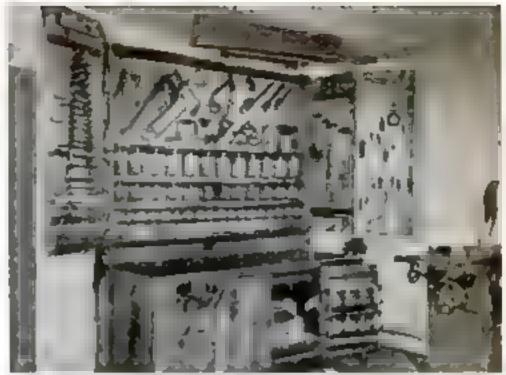

The occassories for this miniature dressing room were made from bits of discarded adds and ends.

160 SCIENCE

This cabinet conceals a complete assortment of woodworking equipment. Ample bench space is provided by a smooth-surfaced top.

Workbenches in Dress Suits

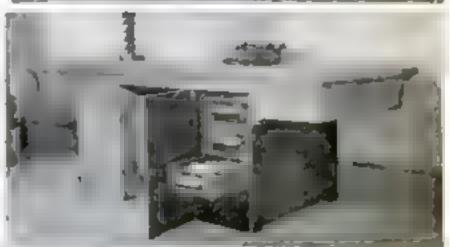

CRAFTSMEN who object to working in the cellar can move into a rumpus room or even the parlor by concealing workbenches in handsome cabinets and tables. As shown by these samples, such dressed-up benches are not only good looking, but their orderliness simplifies work.

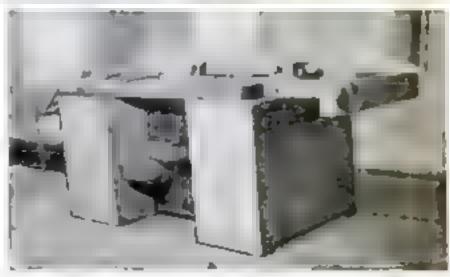

For the compact yet exceptionally roomy cabinet in the photographs above, Sydney Oshrin, of Huntington, N. Y., made a frame of bolted two-by-fours. The workbench top is K" composition board glued on 2" by 10" planks, while other parts are K" pine finished with walnut stain. An organized system of storage adds to convenience. Jars of nails, nuts, and bolts are in front, with saws, electric drill, and other large tools above. The right door holds screwdrivers, chisels, and hammers; the left files, phers, and bits.

At right, a modern table camouflages the workbench of Parker E. Hart, of New York City. A hinged whitewood cover and plywood sheathing hide working parts scavenged from several old pieces—pedestal drawer sections of an old desk for the sides, a filing cabinet for the center, and a carpenter's workbench top.

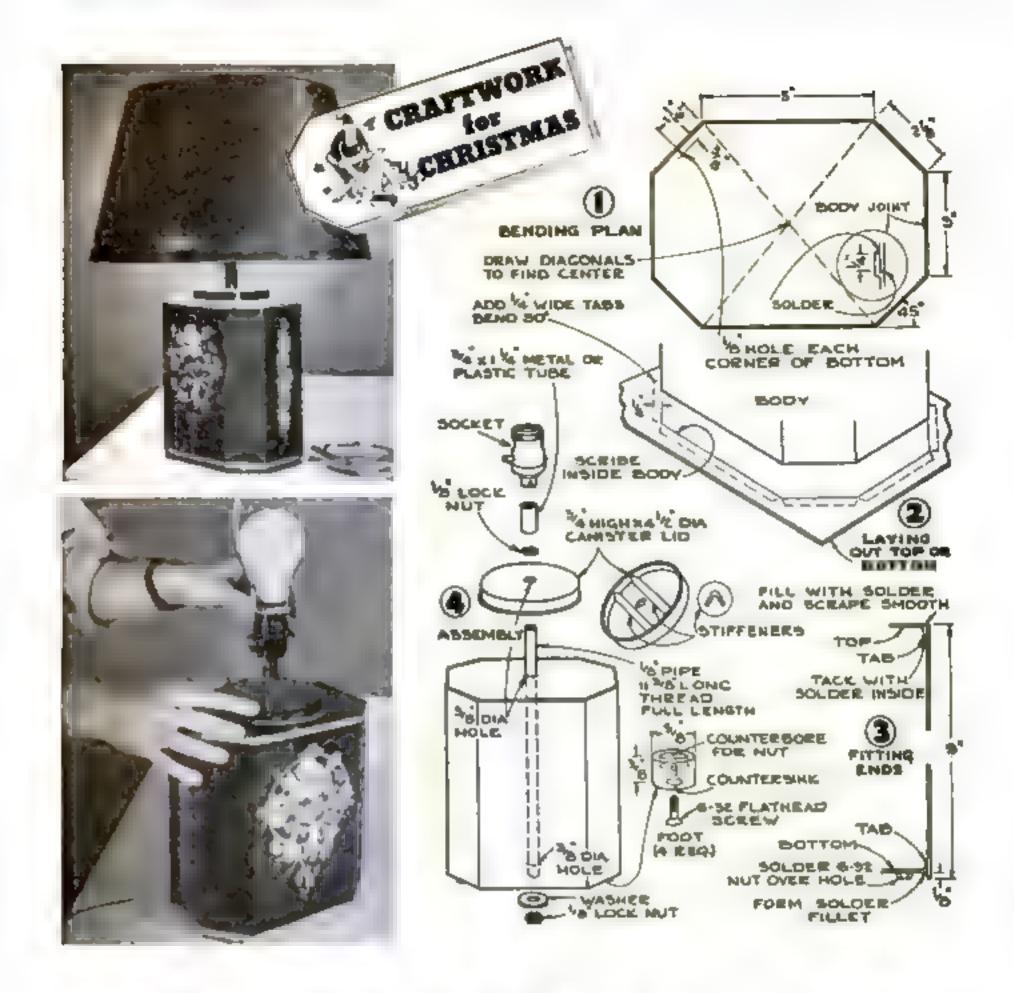

Lowering the hinged cover on the workbanch at the right converts it into a living-room table. Even the vise, set in a recess, is entirely hidden.

Painted METAL Lamp

RESEMBLES OLD TÔLE WARE

Oration with transfers is a sheet-metal lamp. The one shown here and in color on page 117 was made of extra heavy tin plate, enameled, and trimmed with decalcomanias and gilt borders. It resembles the lacquered tôle ware, or painted pewter and sheet iron, that was popular in Holland, Belgium, and France m the eighteenth and nineteenth centuries.

On a 9" by 24%" piece lay out the corner bends called for in Fig. 1. With a bending

▲ PROJECT that lends itself well to dec- brake or by clamping the stock between two iron bars or angle irons, form 45-deg, bends along the scribed lines, taking care to keep them all parallel. The extra %" strip at one end is offset as shown to form a flush joint, Solder inside and outside the seam; then scrape the outside smooth.

> Place the eight-sided body so formed on another piece of stock and scribe around inside each end to mark out the top and bottom of the lamp. Do not cut on the scribed lines, but on others drawn X" outside them.

as in Fig. 2. Cut out and bend the tabs thus formed at 90 deg. to fit inside the body. Tack the top with solder from the inside; then fill the joint with solder from the outside and scrape smooth to a sharp 90-deg. angle. The bottom can be soldered only from the outside, so use plenty of solder to form a fillet, as shown in Fig. 3.

Find the center of each end by drawing diagonals and drill a %" hole there. Drill a %" hole midway of each corner panel and %" from the edge in the bottom. Over each of these four holes, solder a 6-32 nut, as in

Fig. 3.

Four feet are next cut from %" dowel, and then drilled, countersunk, and counterbored. They are held on by 6-32 flathead bolts.

A lid from a kitchen canister or a presstop can, a small metal bowl, or even a pie tin may be used to distribute the strain over the top. It is best to reinforce this member by soldering V-shaped sheet-metal stiffeners inside as shown in the drawing The upper lock nut is turned up against this, a metal or plastic tube slipped over the nut, and the socket threaded tightly against the tube. Then the lamp cord is run through the pipe and out under the bottom. If desired, a double cluster fixture may be mounted instead of a single socket. The lamp can be weighted by pouring sand in through the top hole after inserting the %" pipe in the bottom hole.

For a neat trim to the enameled surface, the edge of the canister lid and the feet may be painted a bright contrasting color. Gilt edging, as on the lamp shown, may be put on cleanly by the use of masking tape. Transfers may be applied to all eight sides or to the four widest panels only. A coat of varnish over all, followed by waxing, will protect the decaleomanias.

If a single lamp is used, the shade can be mounted on a harp screwed on the socket, as in the photos. A brass or plastic finial completes the effect.—HARRY WALTON.

A Roomy Wooden Pirate's Chest to Hold a Child's Treasures

NEATNESS in putting away toys and the like is an easy habit to teach children if it is made into a game. This pirate's chest, especially if it is fitted with a hasp and a simple padlock a child can work, will appeal

as a place to store "treasures."

The chest shown is poplar with a pine top and pine cleats, but any stock on hand will serve. It should be %" thick to make the chest sturdy enough to withstand moving. The chest shown, a good size for the small playroom, is about 15" wide by 30" long and 12" deep.

Put the box together with nailed or screwed butt joints. Wood of full width will save work but may be hard to obtain. Since cleats give sufficient support, narrower boards can merely be jointed with a plane to avoid cracks; but a more workmanlike job will result if the edges are rabbeted or doweled and glued and if glue is also used in the butt joints before nailing.

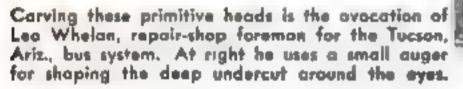

In matching boards for hd, sides, and bottom, warping can be offset by alternating heart and sap sides. It is also well to put the cleats on with the concave side next to the boards and to nail from the center outward.

Use small-headed nails or screws, covering them with upholstery tacks driven in close by for a studded effect. Apply a decal and finish with varnish and wax.—ELMA WALTNER.

Wood Sculpture with a Penknife

Leo WHELAN just likes to carve these distorted faces. During business hours he's repair-shop foreman for the Tucson, Ariz., bus system, but in his spare time he whittles primitive heads and animals from wood blocks.

Whelan's free-hour work is art for art's sake. He sells none of it. Most of the figures are purely decorative, although he has made a few functional pieces, such as a lapel pin with a painted African face, and

a penholder in the form of a small deer. No complicated tools are required. Whe-

lan uses a lathe to turn the preliminary rough cuts on a head, and then finishes with knives. In addition to two pocketknives, he employs a special, extra-sharp knife ground from a file, which holds its cutting edge longer than most tools. A small auger held in a pin vise provides special effects like the grooves around the eyes of the heads, and a coping saw cuts the flat surfaces on the

Whelen uses a lathe to turn the rough outlines of his figures; then he finishes the work with knives. Final touches are applied with a tool he made himself, a rozor-sharp knife that was ground from a file.

A coping saw cuts the flat surfaces on the miniature animals. The cigatette is shown for size comparison.

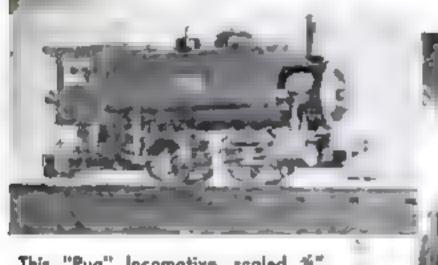

little dogs, donkeys, and other annuals. Almost any type of wood furnishes the raw material for the small figures. Whelan has curved mahogany, redwood, soft pine, desert mesquite, and ironwood. For finish-

ing, paint and varnish are used. The time required to produce a head varies with the size and intricacy; a lapel pin can be made in three hours, while one of the large heads might take 25.

Scale-Model Steam Engines Can Pull Loads as Heavy as One Ton

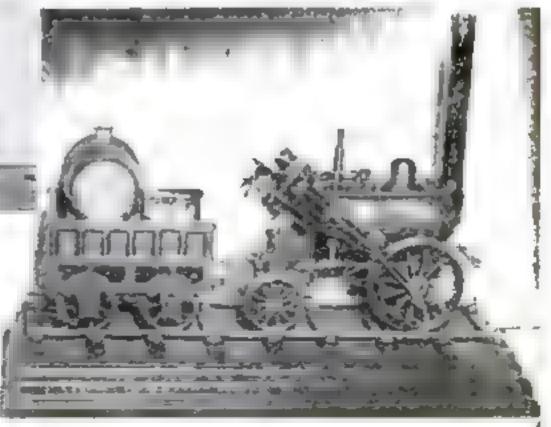

Accurate scale models that really work come from the basement workshop of John Matthews, Chicago plumber. Specializing in steam engines, he has built miniature replicas of a Hudson locomotive, an Atlantic passenger locomotive, and an early mine pump by James Watt, as well as the "Pag"

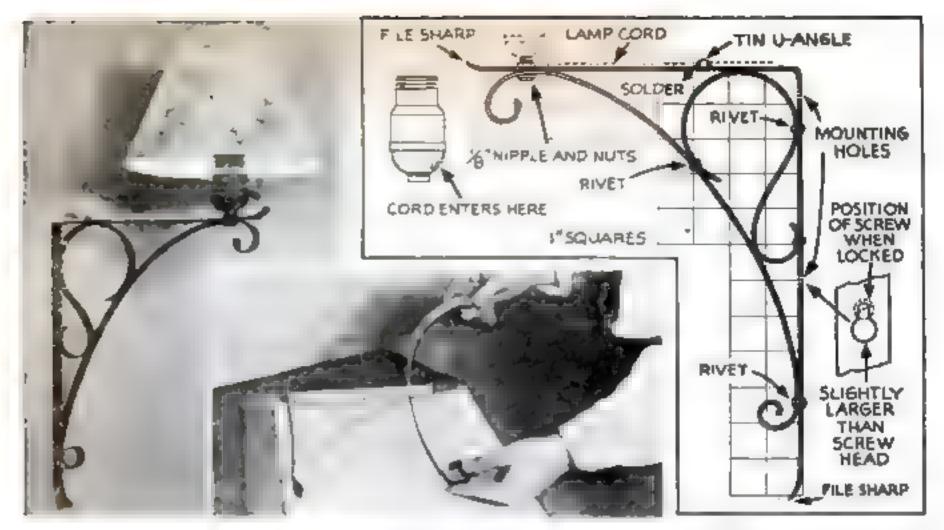

quarry engine and the Stephenson's Rocket shown in the photographs below. Matthews spent 2,000 hours making the Hudson, which is 6' long and weighs 200 lb. It can pull a one-ton load. The 4' long "Atlantic" races along its small tracks under 250-lb. boiler pressure. Matthews works from the original shop blueprints and makes all parts humself.

This "Pug" locomotive, scaled #" equals 1', is a type frequently used in quarries. John Matthews made all parts for the working model himself.

In 1829 the original of the model at right was the latest thing on wheels. A reproduction of George Stephenton's first locomotive, the Rocket, it runs under its own steam.

Pin-up Lamp of Wrought Iron Will Brighten Any Dark Corner

Just the thing for a dark corner or over a favorite chair, this lamp was made of X" strap iron, the S-brace being hammered around a piece of pipe and the other parts shaped over a full-size layout.

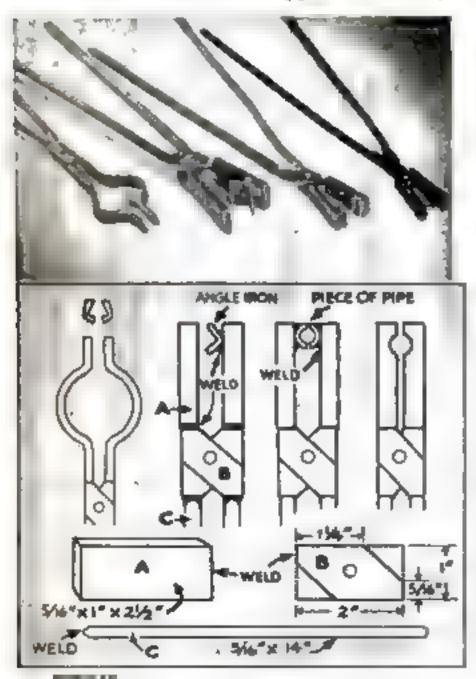

The upper ends of the two main members were bored to take a %" nipple for the key

socket, and two thin nuts placed on the nipple clamp these parts of the bracket together. Mounting holes were bored large enough to slip over the heads of the screws to be used, and slots were then filed upward to accommodate the screw shanks. A coat of black finishes the project.

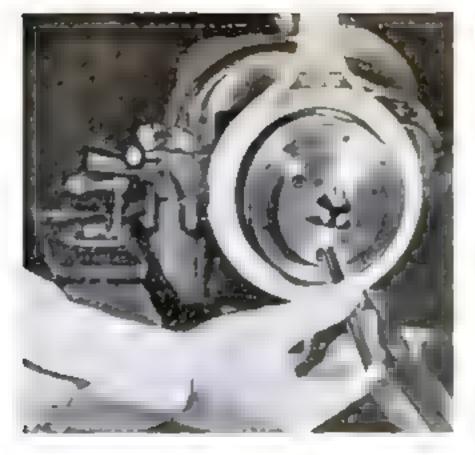

Forge Tongs Welded to Order

STANDARD forge tongs will pull most of your chestnuts out of the fire, but if your forging problem is one that requires extra safety or extra efficiency, it may be well worth your while to weld a pair of tongs with exactly the right grip for your special work. Several useful styles are illustrated at the left, all welded up from standard round and bar stock.

Make the halves of the tongs separately, and join them with a rivet. The hole should be slightly larger than the rivet for easy operation; if it is too tight, heat the tongs to a bright red and work the jaws up and down to loosen. Before welding, grind all butting edges so that they form a "V" when placed together and allow plenty of surface for the weld metal to form a sturdy joint. A piece of angle iron welded into the jaw will hold various sizes of round stock; halves of pipe are useful for a single round-stock size. The recessed semicircle in the jaw makes the tongs suitable for either round or flat stock.—Jerry Pokorny.

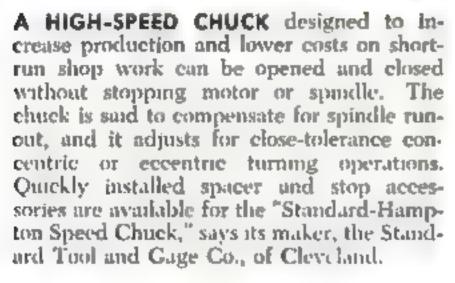

LEG SCIENCE

MULTIPURPOSE TOOIS that carry an assortment of interchangeable bits in their hollow plastic handles are being made for shop, home, and farm use. Bits adapting the different tools to socket-screw, socket-wrench, or auto work as well as general home repairs snap over a swivel mount that reaches hidden parts. Standard Pressed Steel Co., Jenkintown, Pa., is the maker.

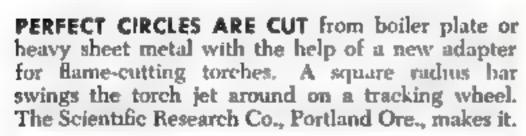

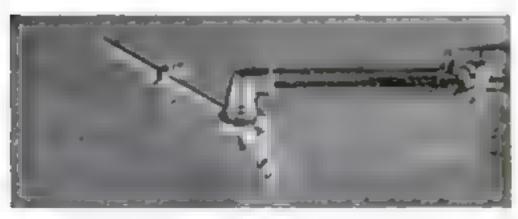

TOGGLE PLIERS that multiply a 40-lb, pressure on the handles to 400 lb, on the work have been developed to hold small parts for

welding, drilling, and the like in cramped spaces. Rubber-enpped pressure pads prevent depression marks on soft metal pieces. The manufacturer is Knu-Vise, Inc., of Detroit.

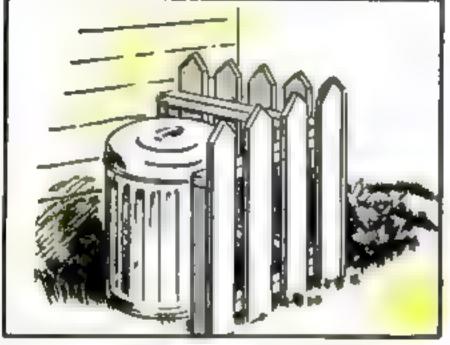

RIVETED FASTENINGS can be used on models and other small shop work easily and quickly with a new lightweight riveting gun of the type used in airplane construction. A one-hand plierlike tool that installs blind 3/32" rivets with a simple pull, it is made by Cherry Rivet Co., of Los Angeles.

KEEPING the HOME SHIPSHAPE

In many hammer-and-saw jobs around the house or shop, it is unnecessary to conceal noil or screw heads on the face of the work. Even such projects, however, can profit from the regular spacing of screws or nails that is the mark of good craftsmanship. A thin strip of scrap wood, notched evenly along one edge, will assure this uniform spacing.

A fireproof smoking set for the workbench can be assembled from a flowerpot, saucer, and marble. Lighted stubs dropped into the pot are quickly extinguished by placing the marble over the hole.

FLOWERPOT AND SAUCER

Before sweeping up a dusty workshop, pour some ail-type furniture polish into the heel of the broom. The liquid will tend to damp the sweepings and help prevent the agitated dust from rising and resettling in other parts of the workroom.

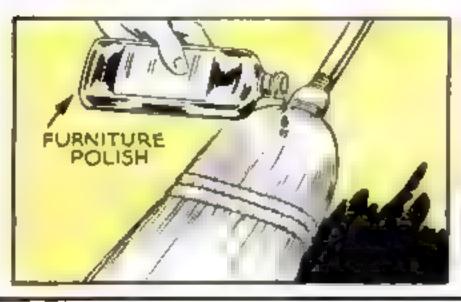

Garbage or ash cans left outside the house for

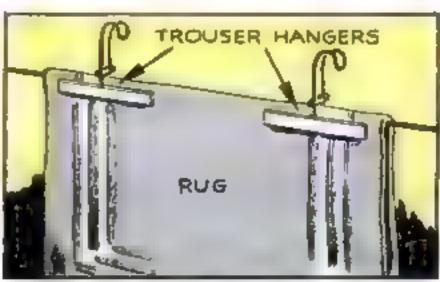

collection tend to mar the appearance of a yard.

A small L-shaped fence will conceal the can while

leaving it accessible for filling and emptying.

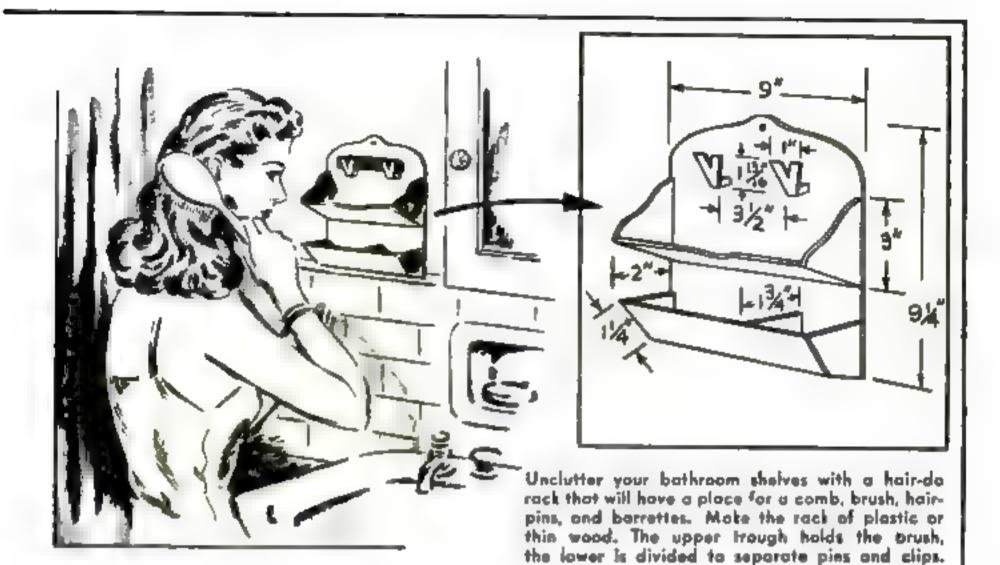

When hanging rugs out for beating or airing, use trouser hangers in place of clothespins as shown below. The hangers can't split on the bulky tabric and they will provide a firm grip without pinching the cloth or pressing down the nap of the rug.

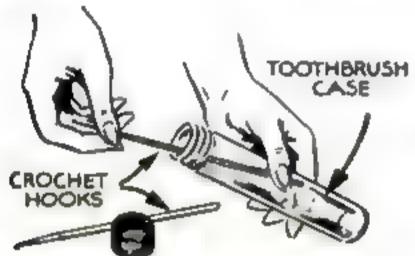

MARBLE

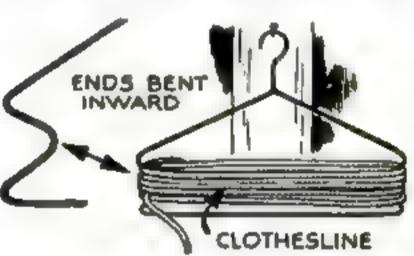

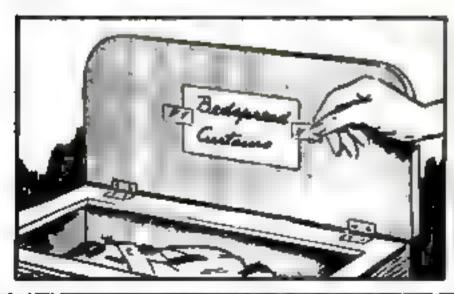

Most clothes hampers are too small to hold the larger articles that go into the family wash. If you are apt to forget such items when you clean out the hamper, fasten a seminder to the cover with easily removable, nonmarring cellulose tope.

getting tangled in and snagging york or motorial.

No tools are needed to make this winder for temporary clotheslines. Bend the ends of a wire coat hanger inward, as shown above, and real the cord around it. Hang it over any convenient hook.

Heavy garments hung outside to air will generally slide together at the center of a sagging line. To keep them properly separated, string a short section of chain between two supports, and hook the hangers through the links at fixed intervals.

Window and Door Frames for Stucco Construction

Plumbing a pulley still in a window frame ofter leveling the head

SEVENTH OF A SERIES

Windle plastering is begun on interior walls, while door frames can be set at any time. Frames set beforehand serve as grounds, or the wood to which the plaster can be brought flush and on which the moldings are attached. They should be well oiled or primed as a protection against moisture.

The size of a frame for a double-hung window will depend, of course, on the size

By EDWIN M LOVE

of the sush chosen. In many parts of the country, double-hung sash is listed according to over-all dimensions, and thus the frame for a 2' 6" by 4' 0" window would be built with an opening that

Windows in some sections, however, are figured from stock-size glass, such is panes 26" wide and 20" or 22" high. Allowing for a 2" stile on each side, the width would thus be the same or 2' 6", but the height would be 3 10' or F 2", that is, the height of two panes, a 2 upper rol, a 3" lower rail, and an allowance of only 1" for the meeting rails since they overlap. Windows cut into four or more lights must be figured for bar thicknesses as well

The house described in this series and shown under construction in the accom-

panying photos is to have a stucco finish, so the photos and drawings show the addition of stucco molding having a recess or groove into which the stucco is anchored. For another outside finish, the essential difference would be only in the outside molding or other trim. Flashing is inserted between the stucco molding and frame and maled right in with the molding.

How the window frame is constructed is shown in Fig. 1. The width of the jamb or pulley stile must allow for double the sash thickness, standard for which is 1%", and also for 1/16" clearance for each sash and for a %" parting bead, or a total of 3%". In addition, with the blind stop nailed on, it must equal the width of the trimmer plus the thickness of plaster and sheathing. If wall-board is substituted for plaster and no sheathing is used, this width will be so narrow that there will be no room for an inside stop unless the blind stop is made thin, and even with a minimum blind stop of %" it may be necessary to nail the inside trim flush with the face of the stile and lap the inside stop over its edge, as in the drawing.

Stock pulley stile comes grooved and ready to saw to length and dress to width. If it becomes sprung edgewise, straightening can only be done when the frame is nailed in the building. Because of a shortage of materials, some carpenters resort to use of clear sheathing boards for frame stock, racking it for as long as possible with cross strips between to permit air seasoning. Even then a board is likely to spring edgewise when ripped and should be left with %" surplus width to allow for jointing one edge and ripping and jointing to width. Little spring results from the second ripping. The grooves

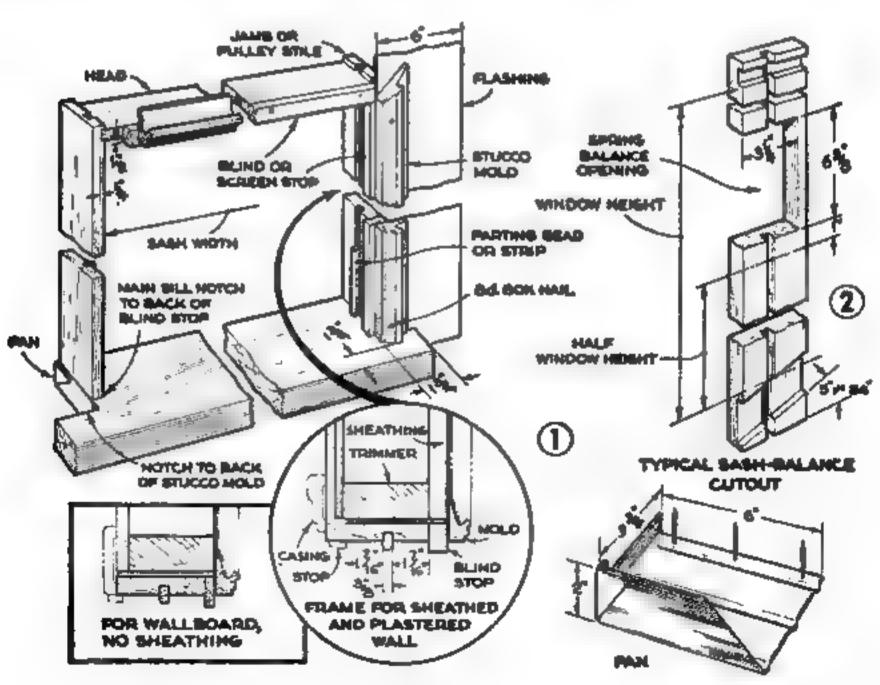

for parting beads are then plowed and the faces smoothed.

Measure window length along the inside edge of the grooves when locating the dadoes to take the head and sill. The dado for the head is cut square; that for the sill on an angle of 5" in 24" or a slope taken from the sill bevel.

Spring balances are often used instead of weights and pulleys. They permit the frame to sit snugly between the trimmers, and narrow casing is easily applied. Figure 2 shows the cutout for a typical spring balance. Bore corner holes; then rip first with a compass saw and finish by crosscutting the ends; or cut the waste out on a power saw. Handle the stile carefully to avoid breaking the slender strip left.

An extra %" must be added to the head for housing in the pulley-stile dadoes, and the same allowance is made when notching the sill. The "horns" of the sill are also notched flush with the front of the blind stops to clear the trimmers. Sometimes %" extra width is allowed in the frame to reduce planing of the sash in fitting.

Never paint the faces of pulley stiles. Oil them instead, or coat them with hot paraffin,

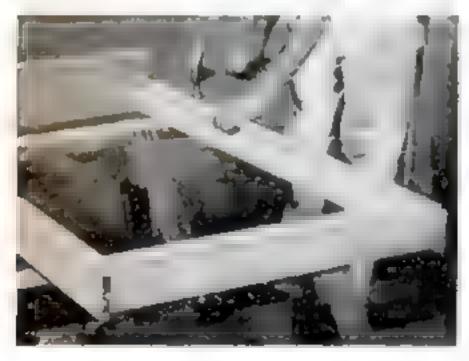

Dadges for housing the sills in pulley stiles are cut on a slope that can usually be taken from the sill bevel, or an angle of 5" in 24" can be used.

When assembling the window-frame head and pulley stiles, take care to get the parting-bead grooves aligned; then dress down projecting edges.

Blind stops are best nailed on while holding a 1/2" black against the stile face to gauge projection

Nailing stucco molding to a gauged line. Floshing is inserted under the molding and nailed with it.

and scrape off any surplus. It is good practice to paint the joints before assembly, and after the frame has been built paint the backs, sill, and stucco molding

Use 8d. box nails for nailing in the sill and head. If a dado is loose, drive a chisel in the joint at the outer side to take up the looseness before nailing. Square the frame by equalizing corner-to-corner measurements, nailing diagonal strips across the inside edges to hold the frame true. Nail the head blind stop in place and fit the side blind stops between it and the sill. Gauge the projection of the stops with a h" block, as in the photo at lower left above.

For correctly setting a window frame, a prop equal in length to the height of the header above the floor will be needed at one corner. Start a nail in the side stucco molding next to the prop near the top, swing the frame approximately level, and tack. Level the sill and tack the opposite molding. Plumb the pulley stile and nail the mold-

ings solidly; then drive nails through the stiles. Wedge with shingles to straighten the face of a stile.

Frames for outside doors can be made from 1" stock with jamb width equal to that of the window pulley stiles. Inside frames require jambs equal in width to the trimmer plus the thickness of the plaster or wallboard on both sides. The length of the jambs from the head to the bottom is samply the length of the door plus an extra %" for clearance. Assemble the door frames on the floor, nailing the joints.

To set an inside-door frame (Fig. 3), stand it in the rough opening and slide a shingle point first from each side behind one jamb. If there is to be a finish floor, place a block the thickness of the floor under the lower end. Tack fast through the shingles while holding a block against the trimmer to gauge the projection for plaster or wallboard.

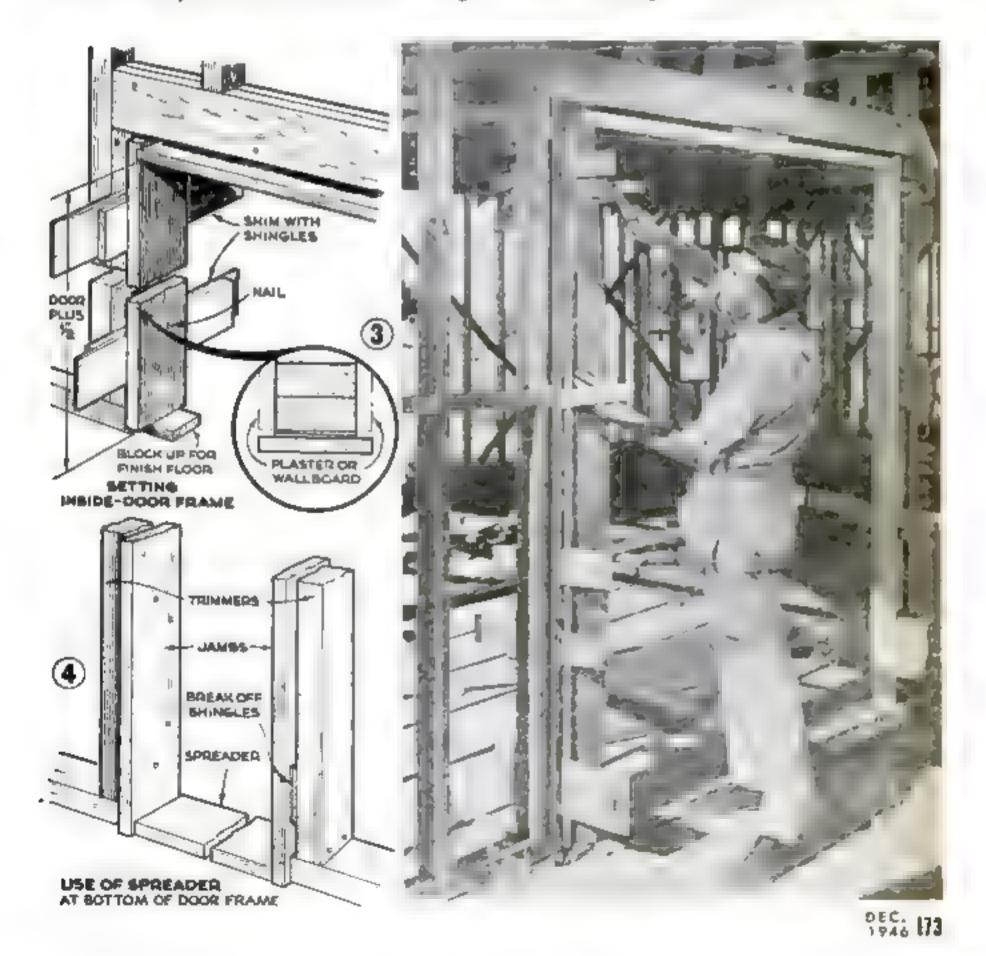

Tack the upper end of the opposite jamb in the same way. Then wedge out and nail the lower end of the first jamb, plumbing the face with level and straightedge to align top and bottom, and plumbing the edge with the level alone. If the wall is too out of plumb, it may be necessary to have the jamb lean with it in order to align them at the top and bottom.

Cut a spreader gauge to be on the floor between the lower ends of the jambs, as in Fig. 4, and nail the second jamb. Place shims behind the hinge and lock positions and wherever needed for straightening out concave bends in the face.

If the molding and flashing are left off outside-door frames until after they have been set, the open edges will make it easy to wedge jambs for straightening, as in the photo below, but some carpenters prefer to nail them in when assembling as for windows. Usually it also saves time to cut hinge mortises in a jamb when it can be handled on the bench before assembly.

Stucco molding used at the head of a door frame and on window-frame heads is usually not in alignment, but the difference will not be noticed if the door is not close to a window. The molding is somewhat higher on a door frame since it must be % to 5/16" up from the face of the door head to show a margin, while that on the window heads is set flush with the face.

One method that simplifies the installation of a door frame in a large opening, such as that for a garage door, is to nail up the head first after leveling it from end to end. Then the jambs are straightened with shingles, as shown below, and nailed in with the upper ends fitted against the head. Flashing and stucco molding or other trun are finally added to complete the installation.

By WALTER E. BURTON

Habulous metals, once undreamed of in the average home workshop, can be yours for little more than some junk-yard prospecting. Stainless steels are among the most fascinating of the alloys developed in recent years. Many types can be found at hardware stores and in scrap-metal yards as war surplus, or may be obtained from regular steel distributors.

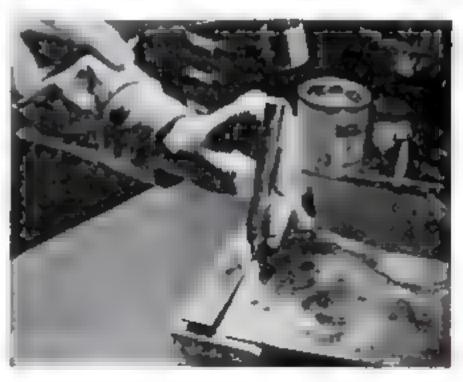

With stainless steel you can make a variety of things for the home, shop, dark-room, laboratory, or wherever its enduring brightness and resistance to rust and corrosion are desirable. You can make covers for photo developing tanks, trays for print-processing solutions, special film racks, and movie-film reels. Numerous kinds of kitchen knives, forks, and other utensils can be fashioned from the alloy. It can be made into tweezers of all sorts, tools for modeling clay, and trowels for handling molding sand, plaster of Paris, concrete, and the like.

Also possible are rings, earrings, brooches, fittings for boats, thin-sheet monograms for automobile doors, handbags, and the like, and dials for gauges and other instruments. Shown on these pages are sugar tongs, a spatula, a darkroom stirrer and print lifter, and a pancake turner—all made from stainless gathered in an afternoon of exploring at a neighborhood junk dealer's.

In searching for stainless steel, probably your first clue will be the absence of rust. If the piece is covered with grease and dirt, rub a spot clear with waste or a stick, and if the metal shows bright, the chances are it's what you want (unless it is obviously too light, in which case it may be aluminum or magnesium alloy). A sure test to tell stainless from other steels is immersion in a strong copper sulphate solution after the surface has been cleaned bright and free of grease. If it is stainless, no red copper deposit will form.

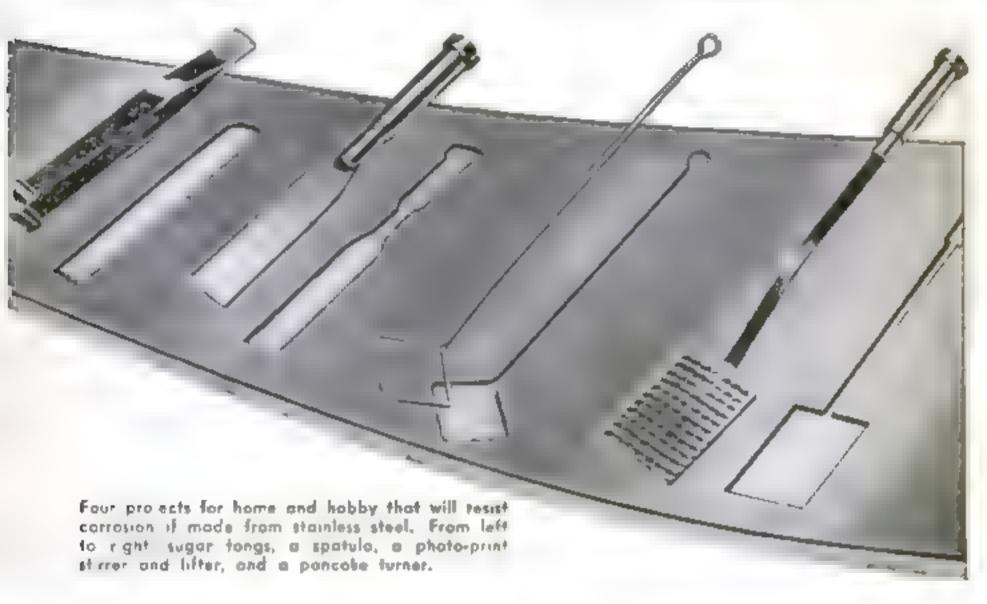

There are magnet and heat tests, too,

Stainless sheet laid on an iron or steel plate can be cut with a chisel. It's best to cut almost through and finish by bending until the cut breaks.

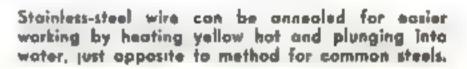

that will identify the type of stainless steel, as described in the data sheet on page 176. These are important when the steel is to be used for making certain projects. Group A, for instance, contains the only stainless that can be hardened by heat treatment for a really good knife blade that will keep an edge, while a developing tray or other object that requires maximum resistance to corrosion is best made from a steel in Group C. This group contains the well-known 18-8 alloy (18 percent chromium and 8 percent nickel) and is the only group that is nonmagnetic.

Despite its hardness, stainless steel can be worked readily with proper tools. Drills and cutting tools should be of high-speed steel and should be sharp. They must be fed into the work at a slower speed than that for cold-rolled steel and with constant pressure, for even the slightest relaxation, may cause the alloy to glaze over and resist further cutting. Punch marks should be shallow, as the steel has a tendency to work-harden. Since Group B and Group C stainless steel may already be work-hardened before you get them, annealing by heating yellow-hot and plunging in water may save

Inserting a stainless spatula blade in a handle made from an aluminum bolt. Stainless rivets cut from wire are shown on the bench at lower left.

1944 175

Silver-soldering a set of kitchen tangs. Flux and a shim of solder are sandwicked between the steel and clamped, and the tarch is then applied.

Short lengths of stainless-steel wire are riveted by peening the ends with a coarse nail set. Here the handle is riveted to a pancake turner.

time. This procedure is, of course, the exact opposite to ordinary steel annealing methods and, as it implies, the stainless steels in these groups cannot be heat-hardened.

Thin stock can usually be drilled without a lubricant if backed by a block of ordinary steel or iron. Lubricants used include sulphurized mineral oils and sulphurized lard oil, sometimes with turpentine added, and also water emulsions.

An excellent chisel for cutting sheet roughly to shape preliminary to filing can be made by mounting a X" round or square high-speed-steel lathe bit in the end of a piece of X" cold-rolled stock. Grind the bit

to a chisel edge that is not too blunt. Cut part way through the sheet and finish by bending the metal back and forth until the cut breaks through.

All of the stainless steels may be joined with soft solder or with the harder soldering alloys melting at about 1,175 deg. F. They may also be silver-soldered to copper or other steels. When silver-soldering, coat both surfaces to be joined with the recommended flux, sandwich a bit of sheet solder between, clamp, and heat until the solder flows, then wash off excess flux with hot water. Stainless-steel rivets can be made by annealing and cutting Group C wire.

PROPERTIES OF STAINLESS STEEL

[METAL WORKING]

Metallinguits classify stainless or chromium steel in the following three groups

Group A (martensitie), containing less than 0.4 percent carbon, less than 16 percent chromium Tungsten, nickel, silicon, columbium, aluminum, and molybdenum may also be present. The steel is magnetic

Group 8 (ferritic), containing low carbon percentage more than 18 percent chromium. Copper, nickel, silicon, molybdenum, integraten, and nitrogen may also be present in small quantities. The steel is magnetic.

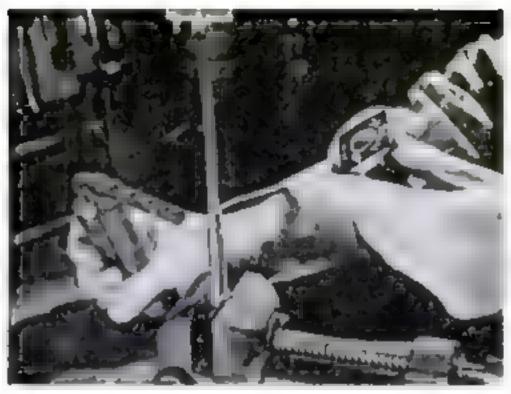

Group G toustenitie), containing at least 24 percent alloy, including sufficient nickel to make the steel austrantic and cuber twice as much or half as much chromium as nickel. Low carbon. The steel is nonmagnetic.

By cross-checking with two tests, a sample can usually be identified. If it is attracted by a magnet, it is in Group A or Group B; if not, it is in Group C. When heated yellow-hot (about 1,800 deg. F.) and quenched in water, it is in Group A if it hardens like tool steel, in Group B or Group C if it does not harden.

Steels in Group A are tough, not brittle, after heat treatment, are readily forged, pserced, or rolled at 2,000 to 1,700 deg. F., and can be machined satisfactorily with properly designed tools. Those in Group B are sufficiently tough when properly rolled and heated, they may be forged, rolled, or pierced when heated quickly and can be machined with properly designed tools. The Group C steels are extremely tough. They may be forged, rolled, or pierced, but are difficult to machine even with super-high-speed and carbon tools. Use sharp tools, with greater top rake than usual, and cut continuously

Group A resists corrosion by weather, water, steam, and mild corrosives; Group B resists also nitric and other oxidizing agents; Group C resists nearly all corrosives and is especially resistant to organic acids.

POPULAR SCIENCE MONTHLY SHOP DATA

When a flat shook is driven into a round hole, the spaces around it can be filled with solder. Drill holes in the shank first; solder, flowing in, will anchor it.

While the chemical composition of stainless steels makes them resistant to corrosion, a fine polish will increase this resistance; but use aluminum buffing compounds, not iron compounds (rouge), embedded particles of which may later rust. Before polishing, it is advisable to place the finished piece in a solution of equal parts of concentrated nitric acid and water for about an hour and a half, taking care to keep the acid off the skin and clothing. This dissolves bits of the tool embedded in the surface.

The tongs shown were made from 1/32" springy 18-8 stainless bent cold so the jaws stand 1" apart. Similar ones may be of one-piece construction, or identical halves may be riveted or silver-soldered. The spatula, of the same steel, was made with a short tang and riveted in a slot in an aluminumbolt handle that had been machined to remove the threads. Annealed first for easier bending, 3/32" Group C wire was shaped into the stirrer-lifter. The pancake-turner blade was spot-polished .020" by 1%" by 25/16" stainless, the shank .050" by %" by 6%" stainless, and the handle a 7/16" by 2%" aluminum-alloy aircraft bolt.

FORKS OF STAINLESS STEEL won't be discolored by foods. This one, made of 3/32" sheet, is for serving olives and pickles. The prongs are cut with a hacksaw and lubricant, and the shape is then roughed out on a grinding wheel and filed smooth. Contours are bent between soft jaws in a vise.

Polish with several grades of emery cloth from coarse to fine, and finish with aluminum buffing compound.—WILLIAM GORDON.

Tool Turned from Drill Rod Cuts Smooth Dovetail Joints

This dovetail cutter will make blind dovetail recesses in drawer fronts, as at left above, and smooth-sliding dovetail joints like that at right. It will cut both the tongue and socket in the latter piece.

Turn the cutter blank from 3" drill rod, as in Fig. 1, and lay out three equal divisions with lines at 90 deg. Clamp the blank in the drill-press vise, set up a small milling cutter (see PSM, Nov. '46, p. 175) as in Fig.

2, and slide the vise against a fence clamped to the drill-press table as above. File the side of each tooth to a flat angle (Fig. 3), using the tile lightly to finish the edge, and then produce the bottom take with a file, as also shown in Fig. 3.

Harden the cutting end, temper by heating the shank until the straw color travels to the top of the side teeth, and then quench immediately.—HERBERT PRISTER.

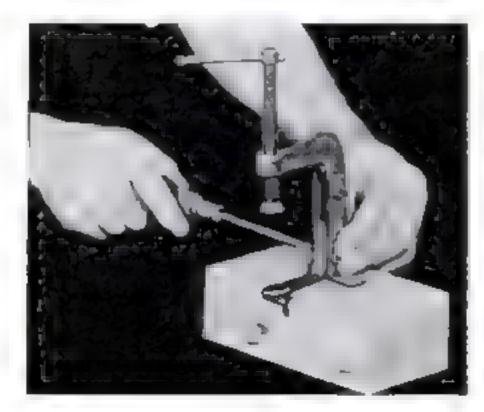

Arbor Press for Handling Small Work Is Made from C-Clamp

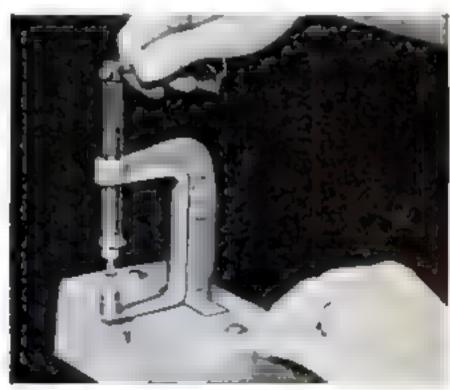

Scaled to modelmaking size, this little arbor press will push study in or out and, in its own small way, do anything a large press can do. It consists of a 35" or 4" C-clamp, preferably one of good quality, held to a slotted hardwood block with two angle brackets.

Recess the block with a chisel to take the clamp web at the stationary-jaw end snugly

up to the flange, and bevel the edges of the block. Drill bolt holes in the clamp frame, bolt it between the brackets, and serew the latter firmly to the block. Paint the clamp, brackets, and block machine gray, but take care not to get paint on the threads.

In use the press is bolted to the bench. Oil the clamp-screw swivel foot to make it work freely.—H. P. S.

NEED DIRECT CURRENT?

IT'S YOURS WITH A LOW
COST, EASILY ASSEMBLED

ELECTROLYTIC RECTIFIER.

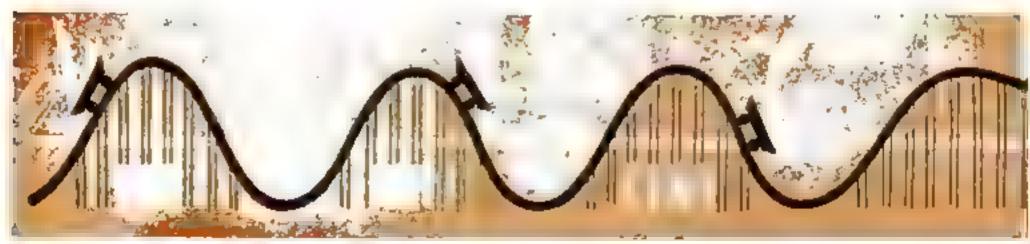

By Harold P. Strand

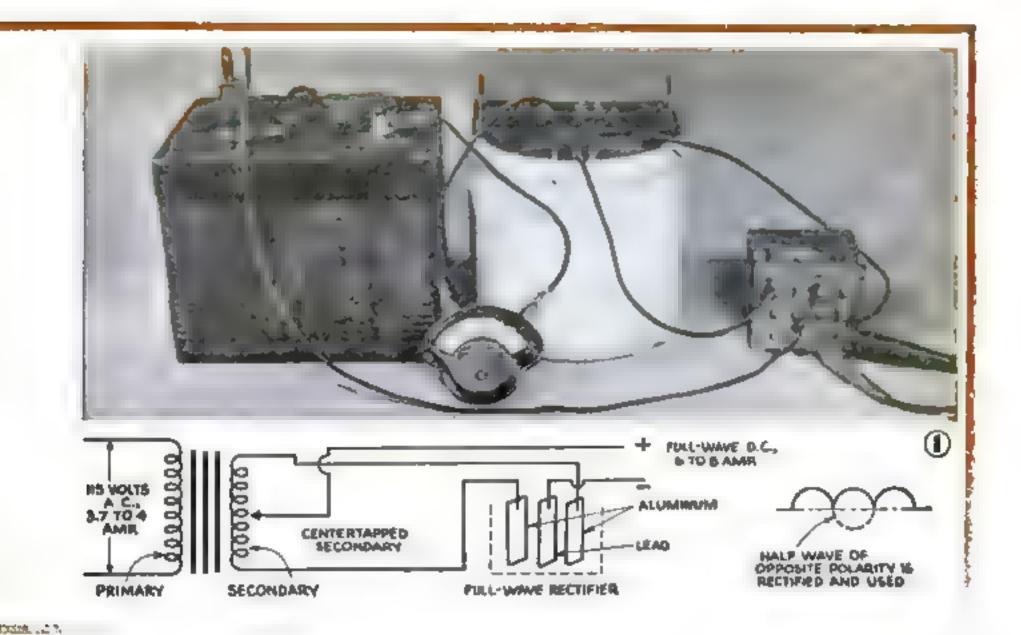

CRUDE as it may seem to engineers and the fortunate few who do their experimenting in well-equipped laboratories, the electrolytic rectifier can boast of advantages over its more efficient rivals. It is cheaper and easier to build than vacuum-tube, dry-disk, or motor-generator rectifiers, yet it is a reliable source of low-voltage D.C., useful for electroplating, charging batteries, and operating model railroads.

Practically all the needed materials will be found around the house or in the scrap box. Chief items are a resistance or transformer to drop the line voltage, a 1-gal, stoneware crock or jar, two small sheets of %" aluminum, one of %" or 1/16" lead, and a panel of bakelite or similar material large enough to span the mouth of the crock. Any one of several chemical solutions will serve as the electrolyte.

In the photo on the facing page, the rectifier is shown in operation as a battery charger. Maximum efficiency is obtained when a transformer with a centertapped secondary is used as shown in Fig. 1. The charging rate as indicated on the D.C. meter is 6 to 8 amp.; current draw from the line is 3.7 to 4 amp. Output can be varied by altering either the spacing of the plates or the input voltage. A transformer that can deliver 20 volts from either side to the center tap and 10 to 12 amp. without overheating is required. The wire marked with the "plus" sign goes to the corresponding battery terminal or to the anode (plating metal) in an electroplating bath.

For half-wave operation, either a series resistance (Fig. 2) or a transformer (Fig. 3) will serve to reduce the line voltage. In the first case, to get an equivalent charging rate

of 8 amp, would impose a line draw of 15 to 20 amp, because of heat losses in the resistance.

With a heating-unit resistance, shown in the photo at the top of page 182, a charging rate of 1.5 to 2 amp. is obtained at a linecurrent cost of 4 amp. Substituting a lower resistance will increase the output but it will also cause a sharp rise in the input.

A more flexible half-wave rectifier is made with a transformer capable of delivering 18 volts at 11 to 12 amp. Using the connections shown in Fig. 3, it is possible to obtain the relatively efficient charging rate of 5 to 6 amp, with only 2.6 to 3 amp, being drawn by the line,

To build the electrolytic unit, cut one lead and two aluminum plates as shown in Fig. 4, notching the two adjacent ends of one pair so that the plates can be brought close can be used. First prepare a saturated water solution—that is, add the phosphate or other chemical until no more can be absorbed by the water and it begins to settle out to the

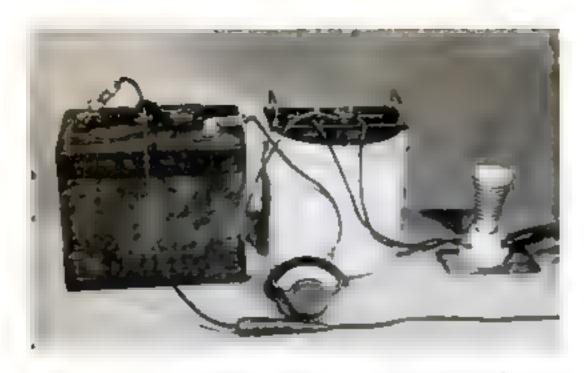

together without making electrical contact.

A strip of bakelite or other insulating plastic is attached to each side of the lead plate as additional insurance against touching.

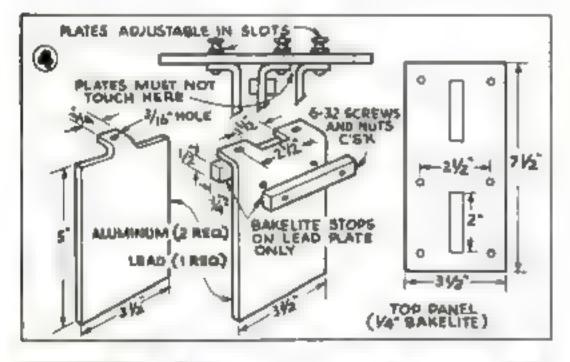

Assembly of the pieces presents no difficulties. The lead plate is attached to the panel with two 8-32 brass machine screws, and a knurled thumb nut is placed over one of the hold-down nuts to act as a terminal post for the negative lead. Use an extra thumb nut on the screw holding each of the aluminum plates.

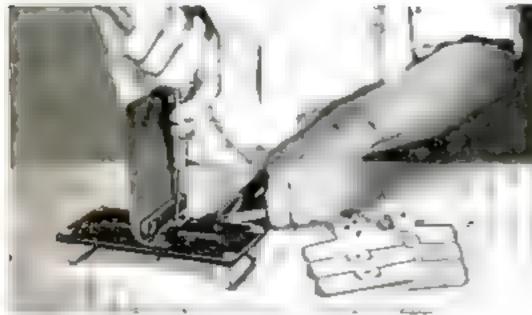

Sodium phosphate, obtainable at any drug store, makes a suitable electrolyte. Ammonium phosphate and household borax are two of the other readily available chemicals that can be used. First prepare a saturated water solution—that is, add the phosphate or other chemical until no more can be absorbed by the water and it begins to settle out to the

182 SCIENCE

When efficiency is not a factor, the use of the series resistance shown at the left is satisfactory. Wiring connections are given in Fig. 2, below.

bottom. Stir the solution thoroughly and wait for it to clear; then pour it off into the crock.

With the plates submerged in the liquid, connect a wire to the binding post atop each plate. Join the outer pair at one terminal of a porcelain socket as seen in the upper righthand photo on page 183. One side of the power line goes to the other socket terminal, while the other side of the line and the wire from the lead, or center, plate constitute the output

or charging lines.

Add a teaspoonful of table salt to a glass of water and place the bared ends of the output wires in this solution. When the power is turned on, tiny bubbles will be seen to form around the wire coming from the lead or negative plate. Touch the wires together and bubbles will begin to form around the aluminum plates. Hold the connection for about 20 minutes to permit a film of aluminum hydroxide to form on the positive plates. This film, acting as a rectifying agent, offers extremely high resistance to the flow of current in one direction and a low resistance in the other.

To measure output voltage, set up a complete circuit so that current will flow; this can be done by connecting a resistance across the rectifier and measuring the voltage across this load. An ammeter in series will tell the current in the circuit.

Servicing boils down chiefly to the problem of offsetting the effects of chemical action. Connections are liable to corrode, especially where screw heads make contact with the plates; the aluminum plates may also wear out

At left, attaching the lead plate with brass machine screws. Note the handles on which the panel rests; simple knobs can be used in place of the handles.

Mix the chemical and water in a saturated solution, stir it well, allow the liquid to clear, and pour it off into the crack.

When both leads are submerged in a salt solution, bubbles will form around the negative wire. Short-circuit the wires to permit a hydroxide film to form on the aluminum plates.

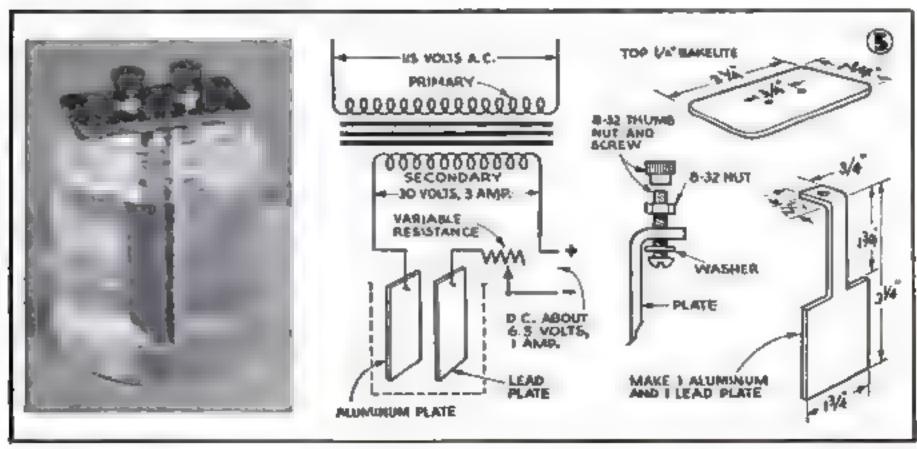

and have to be replaced. Clean the plates from time to time and repeat the forming process to allow the hydroxide film to form again. When the solution shows signs of persistent overheating, and the charging rate cannot be brought up to scratch, it is time to throw out the old liquid and prepare a new batch.

In continuous operation the solution will gradually rise in temperature. If it becomes too hot, or if a heavy current is being drawn, place the crock in a larger vessel and allow a stream of water to run in the space between.

For experimental use, where low-voltage, short-duration D.C. is needed, a simple electrolytic rectifier is illustrated in Fig. 5 and the photo below. Two plates provide half-

wave rectification; the container is an empty fruit jar of about 1-qt, capacity. One lead and one aluminum plate, spaced about %" apart and supported by 8-32 screws and nuts, constitute the vital parts. The same electrolyte may be used in this outfit as in the larger one.

Since the output of the smaller unit is low at best, it should be used only with a transformer. A heavy-duty toy train transformer able to deliver about 30 volts in the secondary should serve nicely. With the latter input, an output of about 1 amp, at 6 to 6.5 volts can be obtained. The output can be raised somewhat by using a higher input voltage, but if more service is required of the rectifier, it would probably be better to build the larger one described above.

Putting an Old Tripod Back on its Feet

BROKEN-DOWN tripods that look as if their picture-taking days are over can often be rebuilt to serve for many more years. And with good new equipment still scarce, even extensive rehabilitation may be worth the effort. The illustrations below show the most commonly needed repairs.

Start by examining the top carefully for cracks, holes, and loose screws. Minor cracks in metal tops can be stopped by drilling a small hole just ahead of the split. More serious damage requires soldering, or brass reinforcing plates held with machine screws. In wood tops, use plastic filler to plug cracks

and pack loose screw holes. Sometimes the whole top may have to be separated into its component plies and reglied.

The screw fitting the camera socket, subject to much hard wear, frequently must be replaced. A standard 4"-20 bolt can be used, or a special screw having these threads made up in the lathe with either a knurled head or a transverse pin as a finger grip. To keep the screw from coming out of the plate, form a neck on the screw as shown in the drawing, thread the plate, and burr the threads in the plate after the screw is on. Or make up a plate of metal disks with cen-

Splits in metal tripod legs are fixed by soldering the break over a parcelain tube and fiting flush

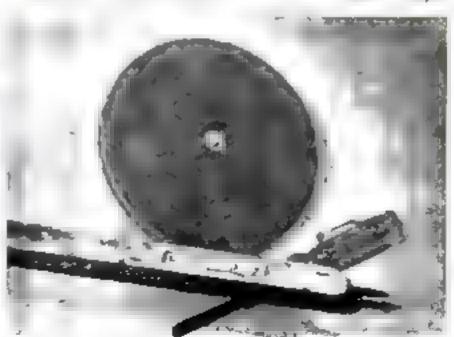

Open plies in wood tops are separated, sanded clean, and reassembled after coating each with glue.

To restore brightness to tarnished brass hardware, dip in nitric acid and neutralize in washing soda.

Broken legs should be carefully glued together and reinforced with dowels or recessed brass strips.

184 SCIENCE

tral holes just large enough for the screw shoulder, but too small for the threads Both disks, slit from edge to hole, are bent to slip around the screw and then flattened and fastened to the tripod top.

Other parts that often wear badly are knurled knobs. Sore fingers can be avoided by turning down the screw head and soldering on a wing nut. In many tubular metal tripods, push-button catches adjust for height. They can be removed for repairs, if necessary, by disassembling the legs, removing the pin in the spring, and pulling out the spring and button. The legs of metal tripods may also have dents that cause them to stick. Hammer out the dents, using a metal rod as an anvil

Secondhand wood tripods generally need refinishing. Remove the old finish, sand rough spots and sharp edges, and apply variash or binoleum lacquer, or rub with boiled linseed oil. Leave sliding surfaces unfinished, lubricating them with wax or soap.—Enwin Walters.

With split top, braken leg, and worn fittings, this tripod went for a quarter of an auction. But anly a few hours' work read ed it for hard service again.

Screws on the height-adjusting clamps were rebuilt better-than-new by shouldering down the heads on a lather and then saldering on wing nuts.

The statches below illustrate several methods for making commonly needed repairs to height-adjust-ment fixtures and tops on wood and metal tripads.

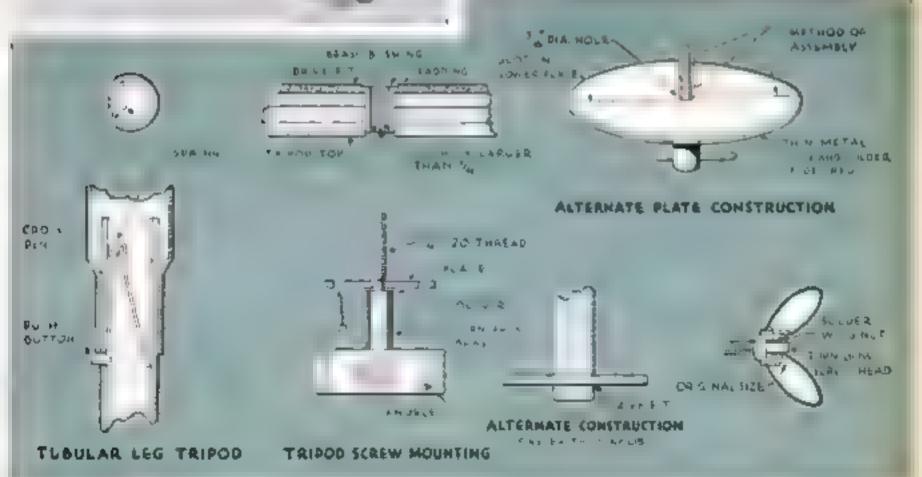

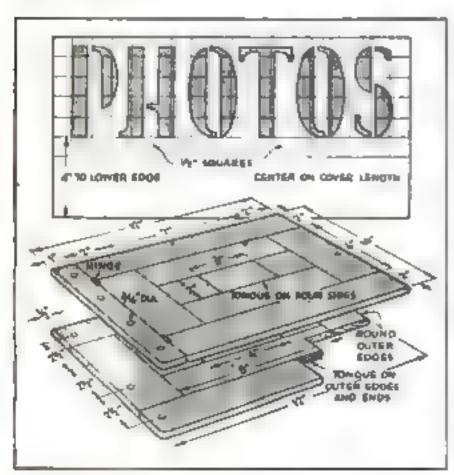

PHOTO IDEAS and EQUIPMENT

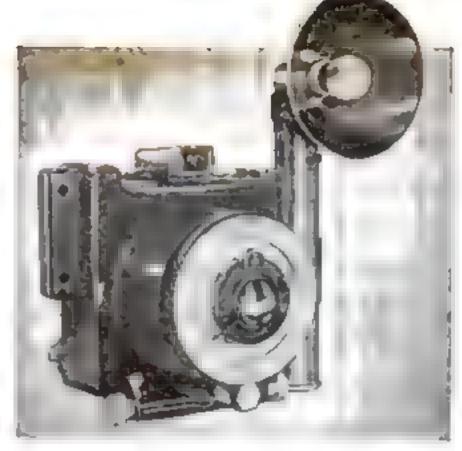

REFLEX FOCUSING of miniature cameras, instead of eye-level operation, is possible with a new view finder equipped with a 50-mm, lens and an automatic focusing arm that moves with the camera lens. The ground glass is masked to show a picture

area the size of standard color film, and the mask moves with the lenses to correct for parallax. DeMornay-Budd, of New York, makes two models—to fit Leica and Contax cameras—and plans them also for other miniatures.

WOODEN ALBUM COVERS can be built up of tongue-and-grooved strips glued at right angles to prevent warp. Make the front cover 1" shorter than the back to allow for a 1" hinged binder. Surface all parts to 5/16" thickness. Decorate the front with a title; the letters are glued on as overlays of thin wood and may be painted to contrast. Lace through the holes and filler sheets.—E.M.L.

METAL "BELLOWS" in the form of a telescoping lens mount are provided on two new Printex press cameras—a 4" by 5" size and a 2%" by 3%" "mini-press." Both models are supplied with a recessed metal lens board taking a wide-angle 3%" lens or reversing to take 6" or 6%" lenses. An optional flat board is for 5" to 5%" lenses.

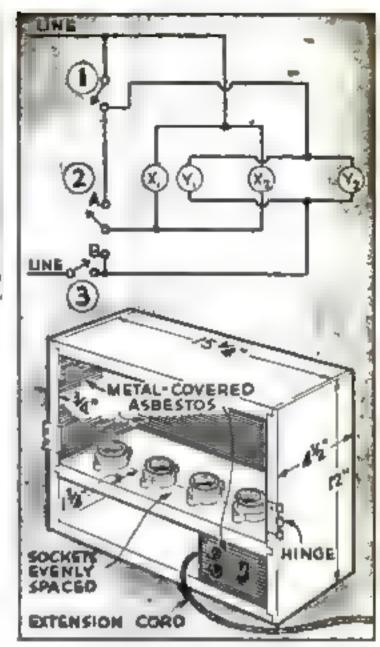

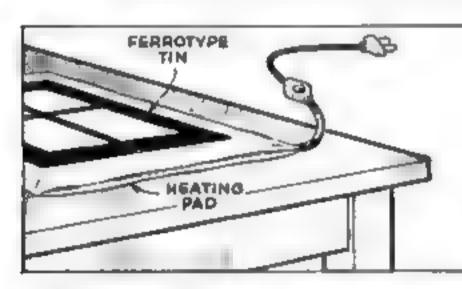

COLOR CORRECTION in light is simplified by use of a meter scaled for Harrison & Harrison's set of 22 filters. Source light reflected from a white card is viewed through the meter, which is rotated to show red in an indicator window and further rotated until the color turns almost completely blue. The designated filter for the film being used is then taken from the scale. Two flanking indicator windows provide checks. One should show a definite blue and the other a tinge of red.

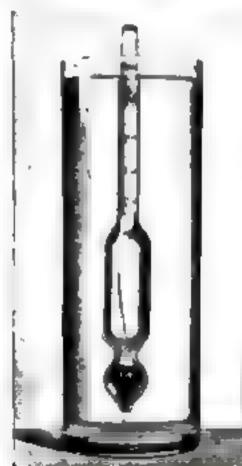

TWIN PHOTOFLOOD BANKS having a variety of light combinations can be built of ordinary equipment. Identical housings with hard composition-board backs are locked by pull-pin hinges to form a portable case. A reflector lining of metal-covered asbestos stove pads prevents scorching. Use No. I photoflood bulbs only and switches and wire that will carry 10 amp.

With the line switch (No. 3) closed, the combinations are: No. 1 closed, No. 2 at B, all lamps bright; No. 1 open, No. 2 at A, all lamps dim; No. 1 open, No. 2 at B, x lamps bright, y out; and No. 1 closed, No. 2 at A, y bright, x out.—R. A. Brewen.

SPEEDIER PRINT DRYING results if the ferrotype plate on which prints have been rolled is placed on a heating pad. Take care not to bend the plate and loosen the prints when moving it. Turn the pad on high, and when it gets warm, turn to medium.—W. E. Danneman.

GLYCERIN BATHS are frequently used for final print rinsing to prevent curling and brittleness from excessive drving. The same solution can be employed over and over again if checked with a hydrometer and kept at proper strength.

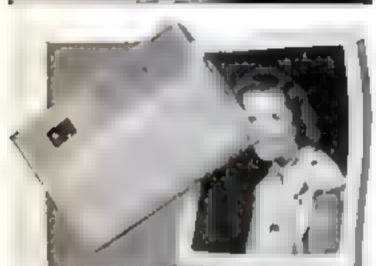

Use a hydrometer designed for liquids heavier than water and having a low scale. For a 5-percent solution, add glycerin to the bath until the hydrometer registers 1.01; for a 10-percent solution, 1.02. Hydrometers may be obtained at a laboratory-supply house.

CAMERA VIBRATION can be minimized in a shop, factory, or the like if each tripod foot is cushioned with half of a sponge-rubber ball. Several thicknesses of rubber from a kneeling pad may be used just as well.—Kenneth Murray.

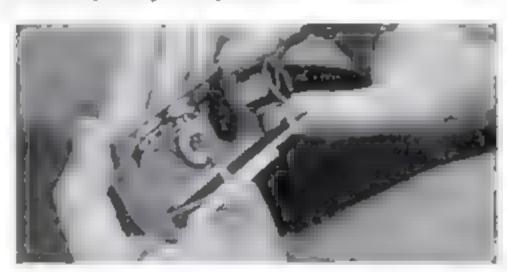

Still Camera Smaller Than Cigarette Pack Uses 16-mm. Film

TRULY vest-pocket in size, a camera smaller than a package of cigarettes takes 24 pictures on a cart-ridge of 16-mm. film. The Micro 16 has a universal-focus lens with three diaphragm stops that focuses objects sharply as close as 3'.

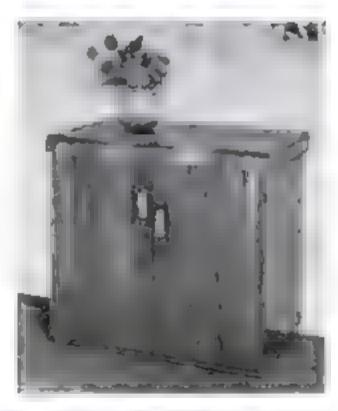

A small trigger on top of the camera operates the shutter, while a plunger on the side advances the film, at the same time moving the internal frame counter. The special film cartridges are enlarged to 2%" by 3%" prints without additional charge by the manufacturer, William R. Whittaker Co., Hollywood, Calif.

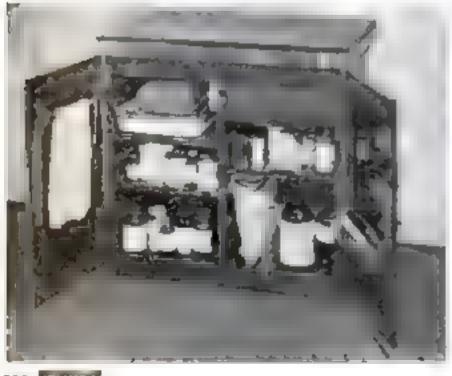

Cabinet Conceals Darkroom Workbench

THE problem of finding darkroom space in small homes and apartments is answered neatly by the "Photo-Bar," a walnut cabinet that conceals hypo and developer instead of Scotch. The top opens to provide a well for three trays, a firm base for the enlarger, and an eye-level cupboard for the timer and safelight.

Inside the wide doors are shelves that can be set at various heights to make economical storage space for bottles of all sizes. A towel rack is mounted on the back of one door, and a paper safe is built in beneath the enlarging easel. Other equipment includes a drain, a box for graduates and thermometer, and a lock. The Hi-Standard Manufacturing Corp., Baldwin, L. I., N. Y., makes it.

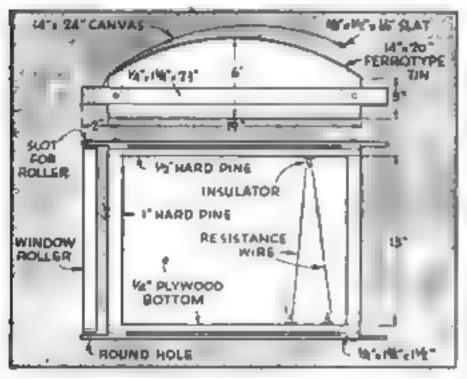

188 SCIENCE

FIVE-MINUTE PRINT DRIER

HEAT for this print drier is furnished by two 660-watt coil-type heater elements connected in series. These elements are generally available as replacements for use in heaters or hot plates. Stretch each coiled

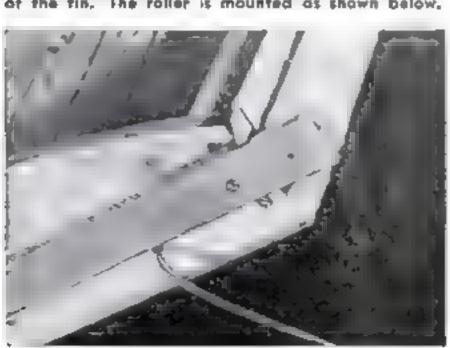

wire to 50", and connect them together. Every 10" form a loop that will accommodate the machine screw on the end of a stand-off insulator. Eleven of these, which are obtainable at radio supply stores, are aligned 2" above the base to hold the wire. If a line switch is used, be sure it will handle 5 amp. at 115 volts (the actual current draw will be around 3 amp.)

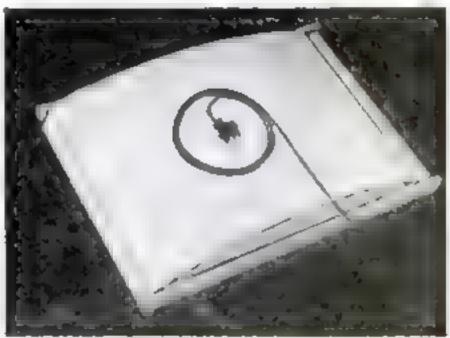

Line the box with sheet asbestos and attach the ferrotype tin with flathead wood screws driven down flush with the metal. A window-shade roller, its pawl removed to give constant spring tension, holds the canvas cover To use, place glossy prints face down on the warm, wet tin, squeegee them, and leave under the cover for about 5 min, after pulling it forward and hooking under the projecting ends. Matte prints may be dried face up.-George O. SMITH.

Since dampness will occur on and near the drier, shelloc all of the wood parts before assembling.

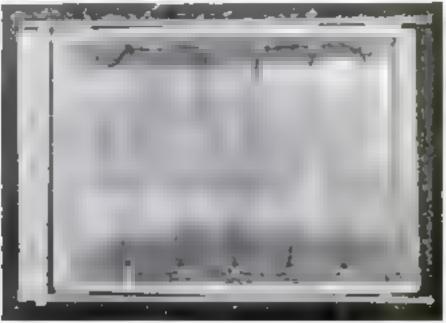

Bevel the end pieces of the box to suit the curve of the tin. The roller is mounted as shown below.

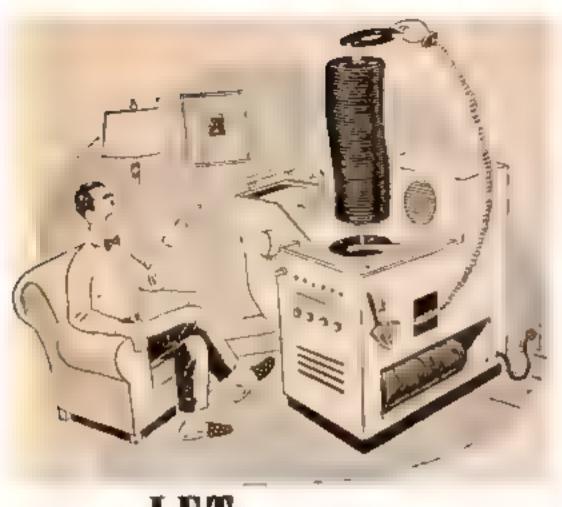

A slat hooks under the projecting side pieces to keep the convas tight while the drier is in use.

Insulators for the wire are spaced evenly an each side. The cord goes through a hole at one corner.

LET

Record Changers MAKE MUSIC FOR YOU

They can be used with any radio to take the labor out of listening.

By HARRY R. HYDER

ACCORDING to current estimates, 300,000,000 phonograph records will have
been made in 1946 by the time New Year's
Eve rolls around. Forget about the hundreds
of millions of records left over from past
years, and you still have a lot of work for
the music-hungry public that has to feed
this endless stream of disks into America's
8,000,000 phonographs. If each of these
records were played only once—and we
know that the average is many times that—
you'd still have too many operations for
a traditionally mechanical and labor-saving
nation to take in its stride.

Of course the problem isn't new, and necessity has long since mothered her

inventions, but technology and increasing public demand are still working at the job of rearing that once-awkward child, the record changer, into a respectable member of our gadget family. Altogether, they haven't done too badly.

Back in the remote twenties when electric phonographs began to replace player pianos as a favorite source of canned music, the joy of having a turntable you didn't have to crank was enough to make even the laziest of us forget that switching records after each playing was an awful lot of work. Then the early record changers made their appearance. With plenty of reason they came to be known as "platter busters." Action was the one thing they had plenty of, but records rarely had better than a 50-50 chance of survival when they went through the clanking mill.

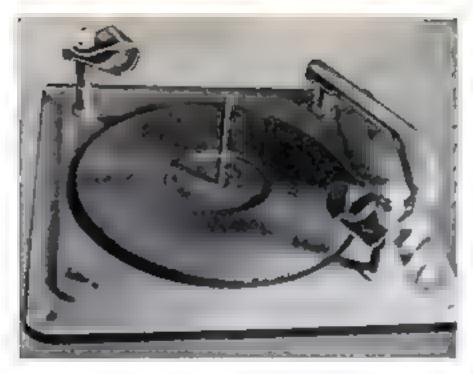

Breakage has continued to be a problem in the mechanical handling of relatively fragile records, but in general it is no longer a serious consideration. Automatic changers now in production have proven themselves quite gentle. Curiously enough, the low-priced units are almost foolproof, while the more expensive jobs still give a small amount of trouble because they have more moving parts to get

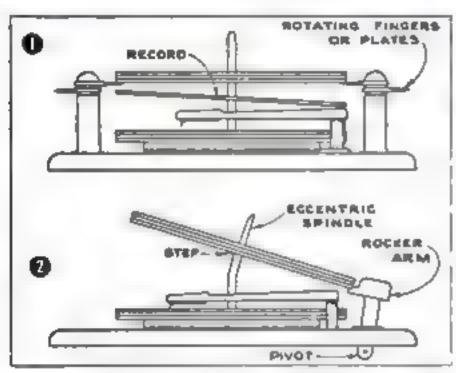

out of adjustment.

Record changers are most commonly found in radio-phonograph combinations, but they can also be purchased separately and connected to any radio set. All of the inexpensive and some of the higher priced models operate on one or both of the two principles illustrated in Figs. 1 and 2, and in the accompanying photos. The first of these employs rotating fingers or plates to suspend the stacked records over the turntable. When the changing mechanism is set in motion, the plates swivel around, releasing the lowest record in the stack and permitting that one to drop while the others stay suspended.

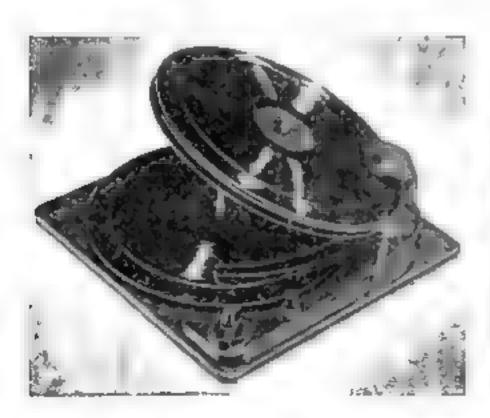

Equally popular is the eccentric-spindle type. The records waiting to be played are

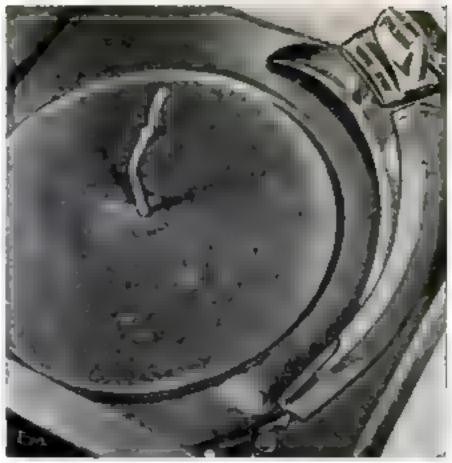

190 SCIENCE

balanced on an inclined, off-center portion of the spindle. A rocker arm at the side of the turntable supports most of the weight of the disks, and when the change cycle is in full swing acts to push the bottom record from the curved to the straight portion of the spindle, from where it can fall to the playing surface. Other things (such as precision of machining) being equal, the second type of changer is less disposed to chip or

The two principles on which most changers operate are illustrated in the diagrams and photos at left and above. In one form or another they turn up in practically all automatic disk handsers.

damage the fragile records than the first. With various modifications and combinations, these principles keep reappearing in practically all except the highest-priced record changers. Below at right is a unit that employs the eccentric spindle and rocker arm plus two supporting fingers; alongside it is a model that is more conventional in appearance but boasts the additional feature of playing an intermixed stack of 10" or 12" records. One of the most

on the following page.

In all types, the change mechanism is triggered by the relatively broad swing of the pickup arm when it engages the run-out spiral at the center of the record. The pickup

elaborate and distinctive outfits is illustrated

The Webster 70, left, uses the eccentric-spindle principle, but plays a mixed stock of 10" and 12" records. Below, rotating fingers and an inclined spindle are combined in the Fornsworth P-50.

944 19

Unique in its field, and more costly than the other changers described, the Capehart, above, will play the first side of successive records to the end of the stack, then turn them all over automatically. In addition, it will turn over individual records, playing first one side, then the next, then change disks.

arm is withdrawn to the side while the new disk drops to the turntable; then the pickup swings back to the first groove and the play-

ing cycle starts afresh.

If you're in the market for a player, bear in mind that pickups are a commodity that must never be bought by the pound. Needle pressure on the better changers is generally 1 oz. or less, and the lightweight pickups are highly desirable from the standpoint of tonal quality as well as for minimum needle scratch and record wear. A permanent or semipermanent needle is, of course, necessary with all changers; there would be little point in saving you the trouble of changing records if you had to change needles after each playing. Semipermanent needles are good for a dozen or more plays, while the permanent variety may be used thousands of times. Once a needle is used, it should never be touched until it is to be removed, since the needle quickly wears down to the shape of the grooves, and even the most minute displacement will cause its sharp edges to cut and scour the sound track.

A cabinet of some sort should be provided for the changer. It is usually most convenient when used in combination with its radio amplifier, but if the radio is too small, or the box cannot be adequately soundproofed, a separate cabinet can be made or purchased for the purpose. A template for cutting the mounting panel is provided by the manufacturer of the changer in most cases. If the unit is intended to be mounted on spring supports, adjusting these so that the changer is free to move slightly will tend to discourage operating noises and

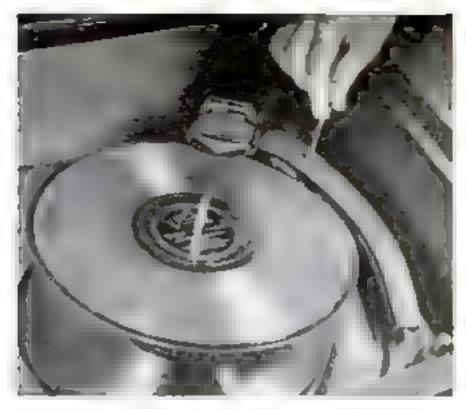

electromechanicalfeedbackknown as "howls."

One amoying characteristic of crystal pickups is "needle chatter" a mechanical noise produced by the needle itself, particularly at high frequencies. When volume is low, the chatter may mask the sound coming from the loudspeaker, causing the set to sound tinny. Soundproofing the cabinet by lining it completely with a soft, absorbent material such as acoustic felt should remedy the situation. Another way is to place the changer in an adjoining room, away from the speaker.

This type of noise should not be confused with needle scratch, which is characteristic of records worn by repeated playings and cannot be eliminated except by means of a high-frequency cutoff filter. Unfortunately, the filter also results in a loss of tonal bril-

Connecting a separate record changer to a radio is usually a simple operation. Where phono jacks are built into the set's chassis, the problem is solved; where no connection is provided for, the center lead of the pickup cable can be soldered to the "hot" side of the volume control and the shield grounded to the chassis (Fig. 3). To differentiate the volume-control terminals, remove the set from its cabinet and, while it is playing at full volume, touch each of the stator terminals of the control with a screwdriver. Touching the hot terminal will cause a hum in the speaker.

A single-pole double-throw toggle switchinstalled on some accessible portion of the chassis allows the amplifier to be turned from radio to phonograph operation. Where

Adjusting the pickup so that the needle will engage the first groove of the record. The position of the screw varies on different models.

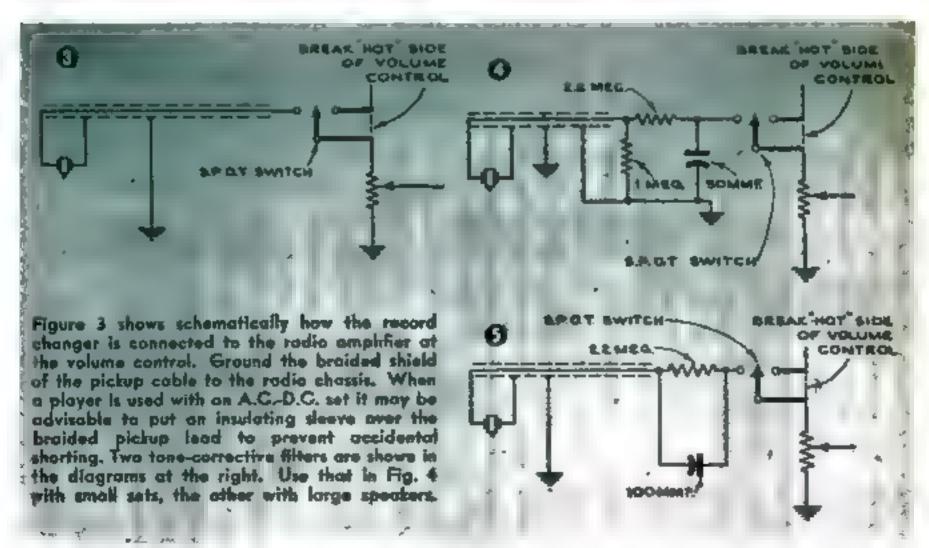

the pickup cable is not long enough to reach the radio, an extra length of shielded wire muy be spliced on and the braid of the two pieces securely bonded together.

Sets of the A.C.-D.C. type should never be grounded externally, since one side of the A.C. line is already grounded to the chassis, and a short circuit would result from plugging the set in with incorrect polarity. Lead wires for the motor should be spaced as far as possible from the braided cable to minimize hum pickup.

Since the output of crystal pickups is not uniform at all frequencies, and since different processes are employed for cutting records, some type of compensating circuit is usually considered desirable on phonograph amplifiers. Two such equalizers are shown in Figs. 4 and 5. Placed between the pickup and the amplifier, the filter shown in Fig. 4 will give a moderate amount of bass boosting and high-frequency attenuation; it is recommended for table model sets having 5" or 6" speakers. Treble boosting is accomplished by the circuit in Fig. 5, and is best for a console with an 8", 10" or 12" speaker and a fairly good audio system. Larger and more elaborate consoles usually have built-in tone controls which permit additional equalization

Properly handled, modern record changers give surprisingly little trouble. Jamming is often caused by warped or off-size records, and failure of the change mechanism to operate is probably due to use of old-style records on which the run-out groove has not been carried far enough over the disk. Sometimes the pickup fails to drop neatly into starting position, but this can be corrected on most changers. The photo at the upper left shows one type being set for proper operation by means of an adjusting screw located near the pickup pivot. On other models the screw is found behind or underneath the pickup arm.

All in all, most of the current crop of record changers will deliver years of trouble-free, pleasurable service. If you like recorded music, you can hardly find a better investment.

NEWS IN ELECTRONICS

DISTANCE is no obstacle to communication on this remote Colorado ranch. Eight ranch houses in the eastern part of the State have been connected by two-way radio with the Cheyenne Wells, Colo., exchange of the Mountain States Telephone Co., from where they can be linked with any phone in the country. Still in the experimental stage, this development is expected to bring service to places where regular wire lines are impractical because of distance. This antenna is 21 miles from the central office.

RECEPTION ON ALL CHANNELS in the F.M. and television bands is promised for this antenna, manufactured by the Andrew Co., of Chicago. Called the "Di-Fan," the unit consists of a fanlike array of five elements extended in two directions; its impedance is matched to that of the lead-in lines. It is sold with brackets for mounting it to chimney or roof.

SILICON CRYSTAL CONVERTERS, developed for radar receivers, are now available through civilian distribution channels. As space-saving first detectors in superheterodyne circuits, the permanent presencrystals are capable of handling frequencies up to 10,000 mc. The model at the right is offered by the Sylvania Electric Products Co.

A PHONOGRAPH PICKUP employing the principle of torsional magnetostriction has been announced by the Magnetostriction

Devices Co., of Boston. The effect of magnetism on the size or shape of an object is said to have made possible a light-pressure, low-cost pickup with uniform response and relative freedom from harmonic distortion as well as from "needle chatter" and hum pickup.

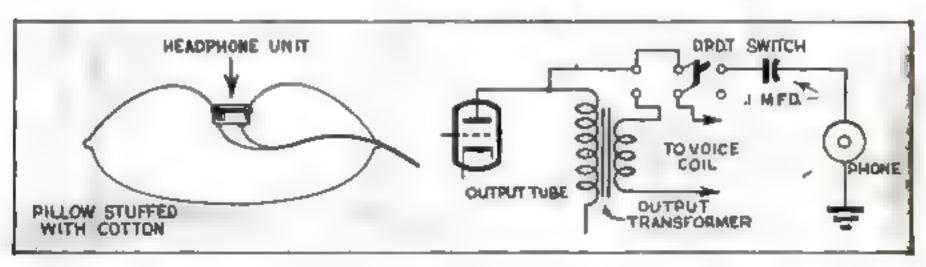

Pillow Phone Mutes Late Music

IF You like to let that last musical night-cap rock you off to sleep like one of mother's hillabies, try this way of doing your midnight listening. It's as comfortable for you as it is for the other members of the family who have already succumbed to the sandman. A suitable pillow can be made with tightly packed cotton. Wire any good-quality headphone to the output of your radio as shown, and stitch the phone into a depression formed in the pillow. When used with large consoles, the headphone should come off the second detector instead of the last audio stage.—W. E. Danneman.

Reinforcements Stop Record Slipping

stacked phonograph records sometimes skid over the records underneath, resulting in musical distortion. One frequently effective method of preventing this slippage consists of gumming three or four loose-leaf reinforcements on each record to increase the friction between the disks.—G O.S.

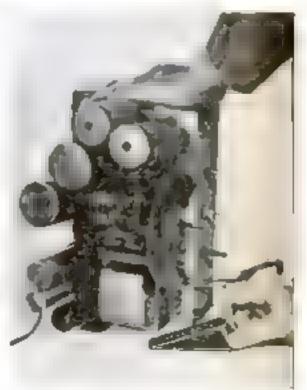

Doorstop Pegs Radio

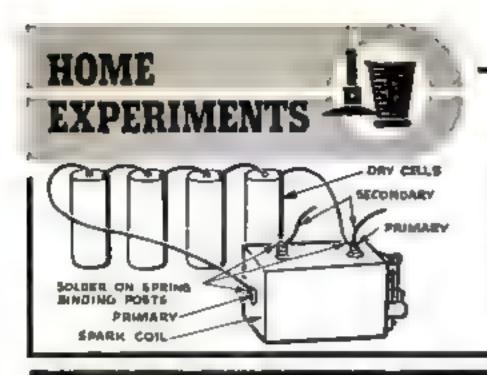

When you stand a radio on end for servicing, slip a wedge-shaped doorstop under some solid part to keep the weight of the set off tubes and coils and prevent the chassis from tipping. Flexible stops of the type illustrated below can be purchased at hardware, novelty or dimestores.—H. LEEPER

Concealed Antenna

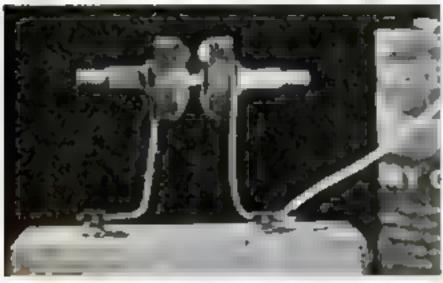

SHORT antennas need not consist of wires dangled out the window or bunched up behind the furniture. Screws driven into the bottom of the radio cabinet diagonally from each corner make convenient pegs for antenna wire as shown at the left.—ROBERT H. DALTON.

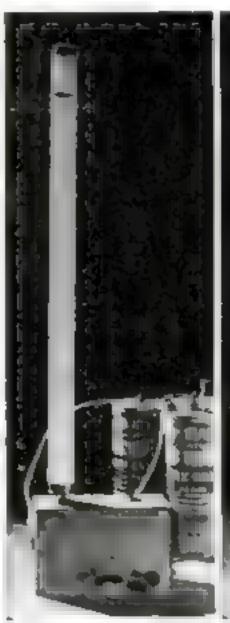

FOUR DRY CELLS connected in series with a spark coil of the type used in the Model T Ford will enable you to perform the experiments on these pages. For convenience, solder a spring-type binding post to each of the three terminals of the coil. As shown at left, one lead of both the primary and secondary goes to the side terminal near the vibrator end.

High-Voltage Fun with a Spark Coil

PRODUCTION OF SPARKS is the function of a spark coil. It can do this because, although the input potential is only a few volts, the output of the secondary may be from 10,000 to 15,000 volts, this high voltage permitting the secondary current to jump at least X". The spark length, however, depends on the terminals, as you can show. First improvise a spark gap with sharp points, drawing them apart (with the current off!) until you get the longest possible spark. Substitute metal silence domes for furniture (as above), and the spark will jump only a fraction as far. The reason? In the case of the points, the charge is concentrated right at these points. When the surface is large, the pressure density is less.

ELECTRIC LIGHTS normally require a closed, or complete, circuit. Yet stand a fluorescent tube on the lone secondary terminal of your coil, supporting it with insulating material; close the primary circuit, and the tube lights dimly—even though the secondary is "open". Balance a pie pan on the tube, and it lights still more strongly. Why? In the first case, the charge in the air about the secondary excites the gas in the tube. In the second, the pan intensifies the electrical flow by acting as the plate of a condenser, accumulating a larger charge than the terminal of the tube alone.

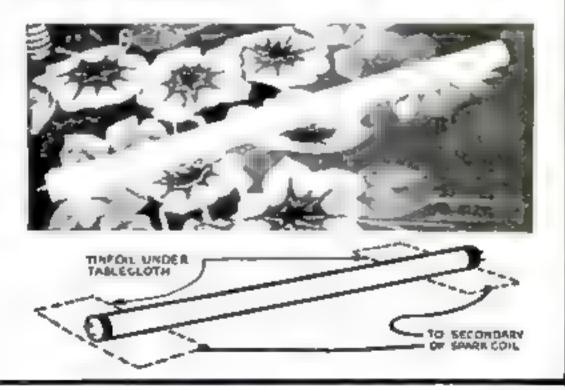

SMOKE IS REDUCED in many cities through use of Cottrell precipitators in industrial plants. The diagram above indicates how you can rig up a working model of such a precipitator with a mailing tube and a piece of tin foil. When the setup is ready, thrust a lighted eigarette or incense stick into the

hole in the tube. Smoke will pour from the top. Connect the primary circuit of your spark coil, as at the right, and the smoke will stop. Although nothing visible happens within the tube, the high-voltage electrical field set up inside causes the smoke particles to clump together and fall to the bottom.

PRACTICAL JOKERS might try this idea. Over the single secondary terminal of the spark coil invert a metal ash tray with tin foil underneath to make an electrical connection. Place a cigarette paper on the tray and, with the current on, move a wire from the other secondary terminal back and forth above the paper, not quite touching it. Invisible sparks will perforate the paper with hundreds of microscopic holes. Try to smoke a cigarette made of it. You'll find it impossible.

HERE'S A TRICK to mystify your friends. Place a fluorescent tube on a table covered with a cloth. At your command, the tube will light or go out—as often as you wish. Before your performance, however, set the stage by placing two strips of tin foil under the cloth and connecting them to the secondary terminals of your spark coil, concealed under the table. Operate the coil with a concealed push-button switch. The tube must be placed with the terminals over the tin foil as shown in the drawing below.

VIOLENS

GRADES OF LUMBER

Under the American lumber standards established by the National Bureau of Standards, yard lumber is divided into the following grades

Select—Lumber of good appearance and finishing qualities.

Grade A-Practically clear. Suitable for natural finishes.

Grade B-Of high quality, generally clear. Suitable also for taking natural finishes.

Grade C-Adapted to high quality paint finishes.

Grade D - Between higher-flushing grades and common grades, and partaking comewhat of the nature of both. Suitable for paint fluishes.

This is the lowest grade listed for use where finishing is required.

[WOODWORKING]

Common-Lumber not of finishing quality but suitable for general utility and construction purposes

No. 1-Sound and tight knotted. May be considered watertight. Suitable for use without waste

No. 2—Less restricted in quality than No. 1, but of the same general character. Also suitable for use without waste.

No. 3—Prevailing grade characteristics lower than in No. 2, Some waste.

No. 4-Low quality. Some waste.

No. 5-Lowest recognized grade, but must be usable. Some waste.

Except in the dimension and timber classifications, the grade of yard immber rough or surfaced two sides is determined from the better or face side. Lumber surfaced one side only is graded from the surfaced side.

POPULAR SCIENCE MONTHLY SHOP DATA

Circular-Saw Bench

HAS KNEE-OPERATED SAFETY SWITCH

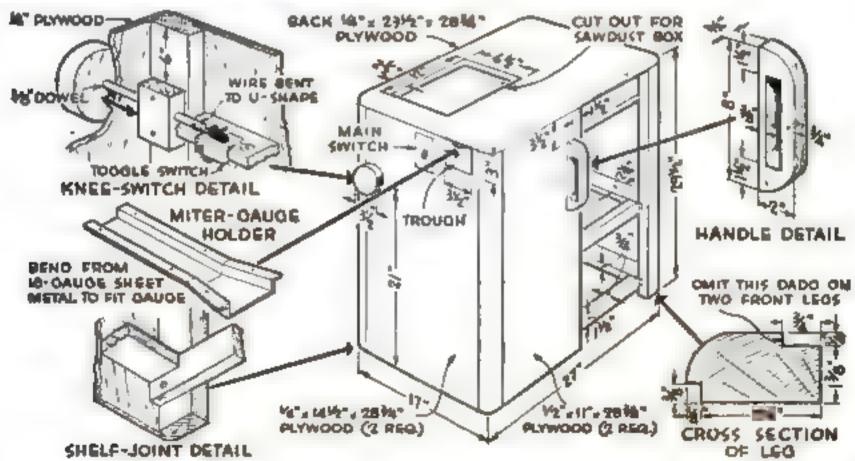

Basic features for both safety and efficiency are incorporated in the design of this home-built bench for a circular saw. A switch, operated by pressure from one knee, will cut off the motor in an emergency when both hands are occupied, and the starting connection can be locked in the "off" position simply by the removal of a wire U. The bench also has a built-in ripping-fence rack, a miter-gauge holder, a built-in sawdust box, and generous cabinet space for holding accessories.

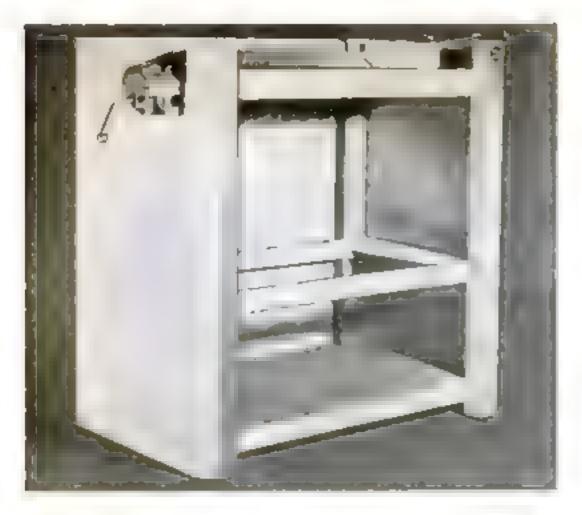

Both the knee switch and the hand-operated main switch on the side of the cabinet must be "on" for the saw to run. Since the former is pushed in for emergency stopping only, it must be pulled out again by hand

before the saw can be started up.

Ordinarily, if there are children about, the only precaution necessary on leaving the saw is to push the knee switch in and turn the toggle switch off, but the wire U connecting the knee-switch dowel to the inside switch can be pulled out as well when the knee switch is in the "off" position. Be sure to have this inside switch in such a position that it can be shut off by the knee plunger even though the U has been removed from the setup.

Parts can be cut on the saw itself if it is

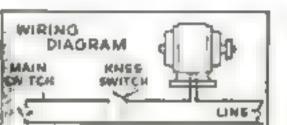

This circular-saw bench cabinet has generous storage space. At right, a view of the table top from the underside. The wiring diagram below shows switch connections.

mounted first on a temporary base. Some change in dimensions may be required to suit the saw for which the bench is intended.

The top for the table shown was salvaged from an old gas ironer and was already glued up in a piece of sufficient size. If a piece large enough cannot be found, a strong table top can be glued up.

In cutting out the handles, drop each side on the saw or dado head to put the hand hole through it. Hold the block against a stop

clamped to the fence, lower it on the saw, and push it ahead. Then shape the ends. Time can be saved in rounding the corners if they are first cut off at 45 deg. and

then two thinner cuts taken at about 25 deg. The sawdust box is slightly larger than its hole and is suspended by a horizontal dower at one end and a hook and eye at the other.

Screw the miter-gauge holder to the top at the middle of the opening for the ripping fence.—R. F. KOEBBEMAN.

Covered Winter Feeder Protects Birds' Food from Weather

Food left out for birds in winter must be protected from rain and snow, or it will get soggy and freeze. A roof over the feeder will solve the problem, though it may cause the birds to be a little timid at first. If you place the feeder on a post about 15' above the ground, however, the birds will eventually learn to disregard the roof, and your yard will become a gathering place for them all through the winter.

Except for the 2" by 2" upright, which should be a good 18' length, all wood can be scrap or pieces from discarded crates. The outside of the feeder may be painted, but the birds will feel more at home if the inside is unpainted.—R. H. Direcks.

Sawing Off a Tight Ring Safely

IF COLD soapy water has failed to remove a tight finger ring, the following method will be found faster and safer than filing it off. Insert a jeweler's saw blade under the narrowest part with the teeth up. Clamp it in the saw frame and saw upward, away from the finger. Soap may be used as a lubricant. Saw slowly to avoid heating the blade by friction. Once cut through, the ring is easily spread a trifle and slipped off.—C. R. Schlegel.

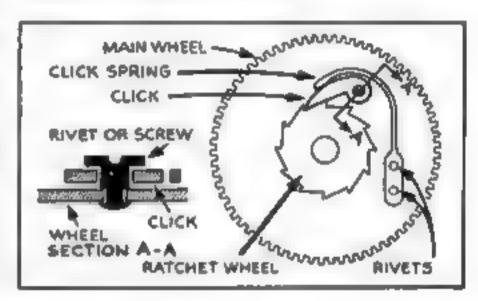

How to Repair a Clock When Mainspring Won't Stay Wound

A COMMON source of trouble in alarm clocks is a defective click (ratchet pawl) or click spring. When either fails, you can wind the mainspring but it unwinds immediately. To fix these parts, first take out the movement, spread the plates, and remove the main wheel, to which the click is attached, on its arbor.

Some clocks have special clicks, for which you may be able to buy a replacement. If not, use a standard one from an old clock, or make one of sheet brass about as thick as the ratchet. Because of the spacing of the spokes, you may have to devise your own way of anchoring the new parts. The click should be riveted to the wheel so that it can move freely. A shoulder rivet is

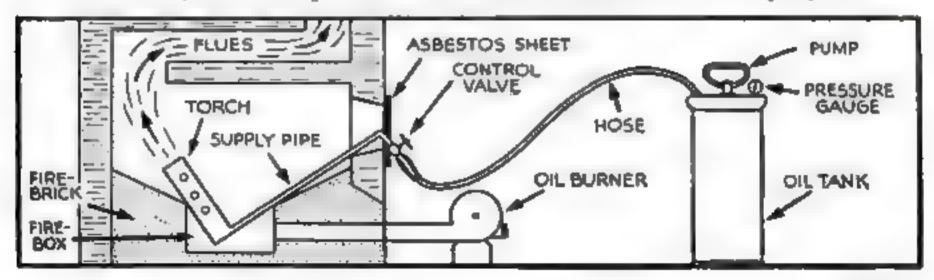

best, but a plain one will do. The shape of the spring may vary considerably, but it should hold the click firmly against the ratchet and should be anchored at two places.—WILLIAM SCHOPP,

Weed-Burning Torch Heats Furnace When Oil Burner Quits

A FAILURE of either electrical power or your oil burner needn't leave the house uninhabitable if you can buy or borrow an oil-burning torch of the kind used for burning weeds. Having its own fuel tank and nozzle, it can be adapted to heat the furnace without altering the regular equipment.

Light the torch and place it in the firebox as shown below; then fit a piece of sheet asbestos over the furnace opening, cutting a notch to admit the torch hose and a certain amount of air. The size of this notch must be determined by experiment while watching the flame. If the regular oil burner is a gun type, remove the access plate at the end of the gun housing to admit extra air. Keep tank pressure up to insure normal combustion.—W. H. JACQUES.

CHEMISTRY answers the Fire Alarm

By KENNETH M. SWEZEY

DROPERLY controlled, fire is one of the I most useful chemical reactions known to man, but out of hand it is an awe-compelling agent of destruction. Despite fire-prevention campaigns and highly efficient fire-fighting equipment, it causes 40,000 casualties and damages nearly half a billion dollars worth of property each year in the United States alone. On the average, a severe fire occurs every 50 minutes.

Most big fires start small. They could be checked easily and with little resultant damage if they were caught in the beginning. Fighting any of the different types of small fires is nothing more than a simple problem in physical chemistry, but the method employed for one fire is not necessarily the best for another.

All ordinary fires are the result of rapid oxidation. For this oxidation to take place.

two conditions must be met: the substance must be heated to its kindling temperature, and there must be sufficient oxygen. Consequently, if we can reduce the temperature of the burning substance below its kindling point or cut off the supply of oxygen, the fire will stop. The two chief methods of fire extinguishing, therefore, are cooling and smothering. Whether one, the other, or both methods should be used depends upon the type of fire.

Soaking the burning material with water is the oldest method of reducing the kindling temperature. With all our modern foams, sprays, and chemical apparatus, water still is the most effective, cheapest, and most abundant medium for extinguishing large fires involving wood, paper, clothing, and

other ordinary inflammable materials. Even the common soda-acid fire extinguisher owes its effectiveness to water.

You can demonstrate this usefulness of water by rigging up an extinguishing apparatus consisting of a 2' length of rubber tubing with the stem of a funnel inserted in one end and the glass part of a medicine dropper in the other. Place a pinchcock at the nozzle end of the tubing to retain the water until needed and fill the funnel and hose with water. Pressure is obtained by elevating the funnel.

Stort a small demonstration fire by igniting a wad of paper in a cake tin. which has been placed on an inverted tin to insulate

Water is the aldest method of extinguishing a fire, and still one of the best. You can prove its efficiency with the simple apparatus shown in this photo.

202 SCIENCE

Different Fires Require Different Extinguishers

ANY good extinguisher may be used on burning wood, paper, clothing, subbish, and ordinary inflommable materials, but water or soda and acid are the most economical.

for oil, grease, gasoline, or paint fires, use foam, corbon dioxide, methyl bromide, corbon tetrochloride, or dry chemicals, never water.

Use carbon diaxide, methyl bramide, carbon letrachloride, or dry chamicals for live electrical wiring that is aftre. Never use any water, foam, or sado and acid.

If blown as dust, bicarbonate of sada will put out a fire.

the table from the heat. When the fire has begun to blaze strongly, play water over the burning material. By maneuvering the stream, you will see how little water is needed to put out the fire.

Another experiment will indicate why water possesses this great cooling and quenching action. Stand a small beaker of water alongside a similar beaker of carbon tetrachloride on an electric hotplate and watch what happens as the liquid warms up. (Perform this experiment in a well-ventilated room.) In a short time the carbon tetrachloride will begin to boil, followed

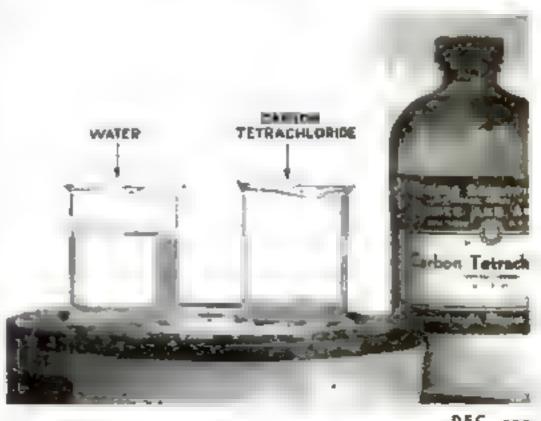

later by the water. This difference is to be expected, since carbon tetrachloride boils at 76.7 deg. C. and water at 100, but a great difference develops in the rate of boiling away. Under ideal conditions, the carbon tetrachloride will boil away about 10 times as fast as the water.

What does this difference mean in terms of fighting fires? It means that, as far as the cooling effect is concerned, water will extract about 10 times as much heat from a fire,

Carbon tetrachloride boils away faster than water, as shown here, but the water obsorbs 10 times more heat. Consequently, water does a better job of putting out a fire, for it cools the flames much more.

pound for pound, as will this other popular fire-extinguishing medium

A fire sometimes can be extinguished by the cooling effect of water without direct contact between the water and the burning material. To demonstrate this, melt some paraffin wax in a small can over a Bunsen thane and continue heating the wax until the vapors burn continuously after being ignited with a match. Then grasp the can with tongs and carefully lower it nearly to its top in a pan of cold water. (Be careful not to spill water on the burning wax, or it will spatter violently.) Soon the flame will

DEC. 203

How a fire may be extinguished simply by cooling the burning substance is illustrated above. Heat a can of paraffin was until a match will ignite the vapor. Then thrust the can in cold water. When the wax has cooled, the flame will go out.

become smaller, then it will flutter, and finally it will go out—the water having lowered the temperature of the wax below its fire point.

Most dry-powder extinguishers depend upon the combined cooling and smothering effect of bicarbonate of soda, sprayed on the flame as a dust. You can show this by placing a little in the end of a paper tube and blowing it suddenly on a small fire similar to the one you made for the first water experiment. If the dust is blown properly, the fire will go out with little or no delay. The explanation of this involves an interesting chemical reaction. Immediately on being heated, bicarbonate of soda decomposes into sodium carbon-

Oil and gasoline fires must be smothered by cutting off the oxygen supply. At the left above is a fire made by lighting a little gasoline floating on water. This fire is easily extinguished by covering the con with cardboard, center. Never use water, for it only spreads the flowes, as demonstrated at right.

If allowed to vaporize, carbon tetrachloride will extinguish all fires. As a demonstration, saturate a bit of cotton with this chemical and hold it over the fire, as at the right. The vapors will smother the flame.

Carbon dioxide also is widely used for oil fires. Prepare a little of this nonburning gos by adding vinegar to ordinary baking soda in a pitcher. Then quickly pour the gas over your fire, as shown at far right, and it will go out.

Foom extinguishers smother a fire because of the presence of carbon diaxide. You can make such a foom by preparing a solution of alum, another of bicarbonate of sodo and gelatin, and then mixing the two.

ate and carbon dioxide. The reaction extracts a large amount of heat from the fire and, in addition, the carbon dioxide acts as a smothering agent. Dry extinguishers are especially good for small oil fires.

As we have shown, water is an excellent extinguisher for ordinary combustibles, but it does more harm than good when thrown upon such burning liquids as oil and gasoline. Since water is heavier, it sinks beneath these liquids, often causing them to overflow and spread the flames.

You can prove this fact in a series of sim-

ple experiments. For all the tests, stand a small tin can in the center of a cake tin resting on another that has been inverted. Fill the can nearly to the top with water, and then pour a little lighter fluid or gasoline on the water. (Use only very small quantities of inflammable fluids, and perform the experiments in the open if possible.)

When you ignite the fluid or gasoline, the fire will look rather formidable, but it can be extinguished with ease by covering the can with a lid, book, or even a sheet of cardboard. Pour water on the fire and the burning liquid will spill over into the pan. If improperly used, even carbon tetrachloride, the chief chemical used in the small pump-type hand extinguisher, will be ineffective and spread such a fire. Squirted into the flame in a solid stream, the

carbon tetrachloride will go through the layer of burning oil and do no good. But if the stream is directed against the farther inside surface of the can above the burning oil, the carbon tetrachloride will scatter into droplets which the heat will vaporize. The noncombustible vapor will smother the fire.

Carbon dioxide and methyl bromide are our most efficient means of smothering an oil fire. Both are supplied in containers in liquid form. When projected on a fire as a liquid spray, each immediately turns into a heavy nonburning gas. Of the two, methyl

> bromide is more expensive, but, weight for weight, it is more effective than carbon dioxide.

> Carbon dioxide trapped in foam also is used as an extinguisher. You can make a demonstration foam by dissolving half a teaspoonful of alum in an ounce of water in one tall glass, and a half teaspoonful of bicarbonate of soda plus a little powdered gelatin in

the same amount of water in another glass. When mixed together, the two clear solutions form a thick foam many times the original volume of the liquids. Chemically, the bicarbonate of soda reacts with the alum to release carbon dioxide bubbles. These are stabilized by the gelatin.

Carbon tetrachloride, carbon dioxide, methyl bromide, and dry chemicals are all effective for electrical fires.

HOW TO FIREPROOF SANTA'S SUIT

IF SANTA is coming to year home this year, it would be well to make his suit and whiskers fire resistant. Prepare a minture of 2 oz. carbonate of soda, 2 oz. ammonia carbonate, 2 ez. boric acid, and 5 gal. water. Boil, strain, and spray on the material.

Home Repairs with RUBBER TAPE

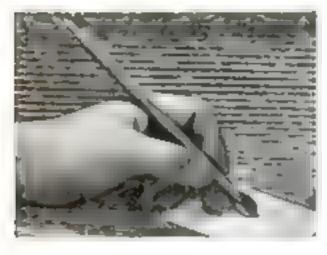

Finger-soving grips for scissors and shears can be made from rubber tape by placing streps around the handles lengthwise and pressing the edges.

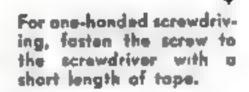

COMFORTABLE grips for tools, small protective "bumpers," replacement tires for vacuum cleaners—these and numerous other handy-around-the-house articles can be made from electrician's live-rubber insulating tape (not friction tape), sold in most dime stores

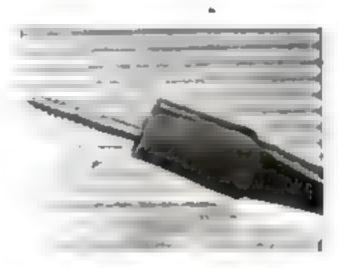

Since it sticks to almost any dry surface and adheres to itself permanently, smooth and resilient tool grips can be made by closely spiralling tape around the handles and pinching the edges together. Covering furniture legs and backs with inconspicuous bits of rubber tape will prevent scratches on floors and walls. For small no-mar bumpers, simply stretch tape over carpet tacks, gather the excess, and press it on the back of the head, trimming away the remainder.

Worn rubber tires on vacuum cleaners and sweepers can actually be retreaded by covering them with strips of tightly-stretched rubber tape.—Kenneth Murray.

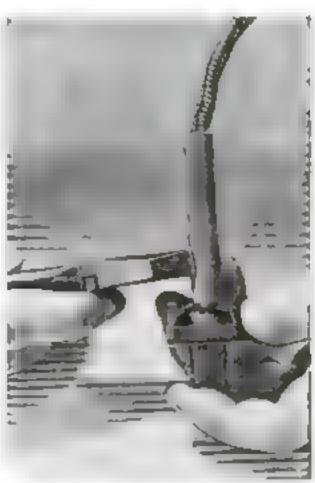

A bit of rubber tape stretched over the end of a drawing pencil provides an efficient eraser.

Rubber tope wound in a spiral around a noil file will provide a comfortable handle. Pinch the edges of the tope and trim any overlap to make a nest, permanent job.

To prevent strain an electric cords when they are pulled from sockets, wrap tape around the wire, starting close to the end. Roll over one end to make a protective flange.

Grain Scoop from Scrap Pipe

Quick, accurate distribution of feed is easy with this grain scoop made of junkpile materials. The scoop section is constructed from a short piece of galvanized stovepipe cut in half and nailed around a semicircular wood back that has been sawed to the same radius as the stove pipe. Taper the front end by cutting off the corners with tin snips.

For the handle, a section of water pipe is used. Slot one end to fit over a brace made of bent strap iron riveted at both ends to the stovepipe The other end of the pipe handle rests in a snug-fitting hole in the wood back. Finish the grain scoop by smoothing sharp corners on the stovepipe and back.—J. P.

Make Your Own Furnace Filters

REPLACEABLE filters for the forced-air heating systems installed in many homes can be made easily from inexpensive materials. The frame, dimensioned to fit the particular humace, consists of four %" strips of scrap wood nailed together with a window-screening bottom.

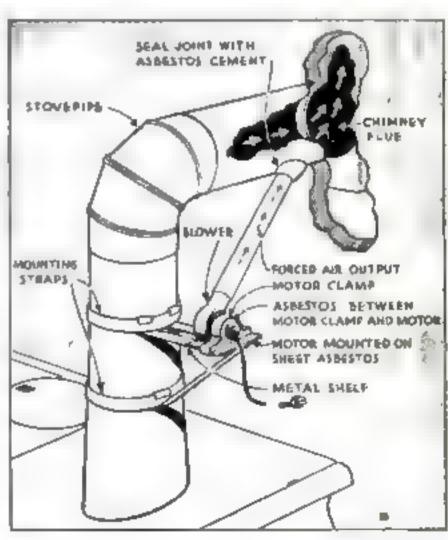

For filler, either steel wool or corrugated cardboard will serve. Grade 0 or 1 steel wool should be soaked in oil, drained, and packed loosely in the frame. If cardboard is used, cut %" strips with a sharp knife, oil, drain, and stack in the frame in two crisscrossing layers. Will Thomas.

Blower Stops Smoke Blow-Back

ATMOSPHERIC down drafts will no longer fill rooms with back-firing smoke from the coal range when the stovepipe is equipped with a forced-air blower. The electrically operated blower counters the down drafts common in mountainous regions with a stream of air that keeps the chimney working in the right direction

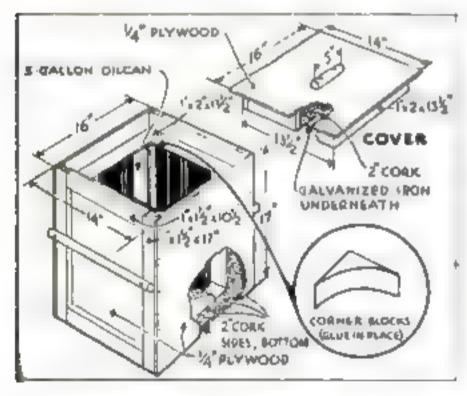

For the installation shown in the sketch, an inexpensive blower designed to cool powerful radio tubes was used. Driven by a 1/200 hp. motor, its speed can be adjusted to outblow most drafts.—H. T. MILLER.

FOR EASIER FARMING

EVEN THE SMART RATS fall for this eatcher, a sack tied to a covered runway made by nailing mesh to a board. It's placed in front of the rats' favorite exit from the chicken house. When I go inside with a flashlight, the rodents dive for the exit. I block it with a brick, go outside, and kill them in the sack.—Willard D. Morgan.

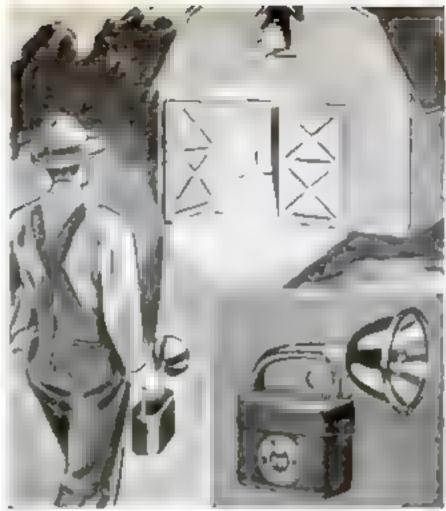

A FROZEN-FOOD CONTAINER that prevents thawing when supplies are taken home from the freezer plant costs little to build. A 5-gal, oil can, some 2" cork, and plywood or fiber board are the chief materials needed.

Cut the top off the oil can and enclose the remaining five sides with at least 2" of cork or other good insulation. Build a box of plywood or fiber board around this assembly. The cover, insulated like the can, should be made carefully so that it fits tightly.

With a piece of dry (ce inside, the box could also be used to keep ice cream hard or bring freshly caught fish back home from a camping trip.—RALPH S. WILKES.

BRIGHT LIGHT anytime and anywhere is afforded by an electric hand lantern that focuses a 1,500' beam or a broad spot at the turn of a single adjustment. Weighing only 5 lb., it has an auxiliary bulb for use when less light is needed. Two standard dry cells are connected by pressure contacts that require no wires. U-C Lite Manufacturing Co., Chicago, is the maker.

property spaced seeds are planted by a new lightweight farm implement made largely of aluminum. The "Equa-Space" seeder, distributed by the Midwest Co., Minneapolis, Minn., can handle a wide variety of seeds from turnips to lima beans. Using a new brush assembly instead of metal parts to con-

A high-precision camera of all-purpose ability

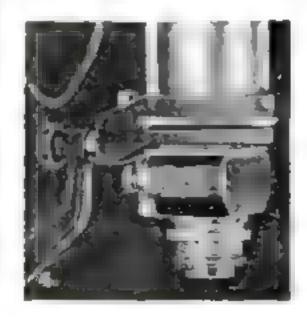

THE KODAK MEDALIST IT differs from other cameras . . . it is different in appearance, in scope, and in adaptability to an almost endless variety of photographic jobs. For you, this means that it is really several cameras in one—and all of them excellent.

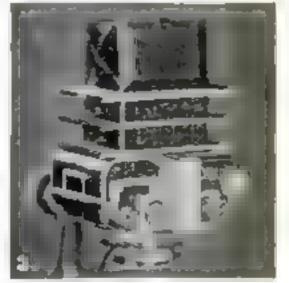

Kodak Medalist II gives you the convenience of 620 (2½ x 3½) roll film—black-and-white or Kodacolor; refinement equal to that of a true precision miniature; and—with various accessories—back extension, ground-glass focusing, and themcans for using film in packs or sheets. In sheet film you have a choice of black-and-white, Kodachrome, or Ektachrome Film. And you can readily adapt your Medalist for high-grade enlarging and copying.

The lens in the highly corrected Kodak Ektar 100mm. f/3.5, finest in the 2½ x 3½ field; superbly mounted, and Lumenized (hard-coated on all glass-air surfaces) for maximum light transmission and color purity, and minimum loss through reflection.

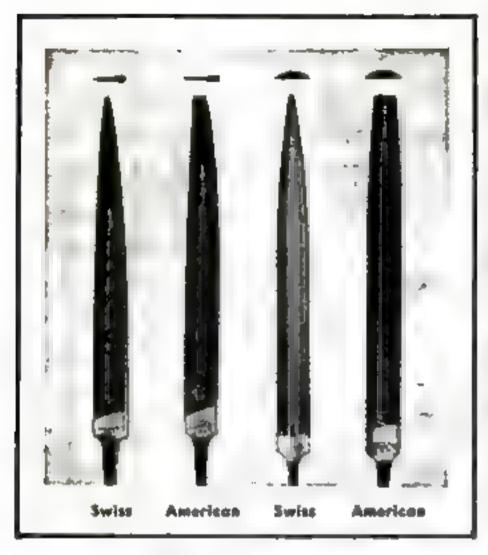

The shutter is a special model of the Kodak Flash Supermatic, the world's most accurate between-thelens shutter; nine speeds from 1 to 1/400 second; eight apertures from f/32 to f/3.5; built-in synchronizedflash contacts with adjustment for Class F (such as SM) or Class M (such as No. 5) Photoflash lamps. The range finder is of the coupled split-field military type.

For further details see your Kodak dealer ... Eastman Kodak Company, Rochester 4, N. Y.

- A 2½ x 3½ precision-built, roll-film comera for flash, color, and regular black-und-white photography
- A film-pack, sheet-film camera with both range finder and ground-glass focusing
- 3. An efficient copying comere
- 4. An enlarger (with special assembly) for its own negatives

HAVE TOU FOUND IT HARD TO OBTAIN SWISS PATTERN FILES?

JUST SAY "X. F." and get them

X.F. means Extra Fine and is part of the trade-mark which distinguishes the Swiss Pattern Files made by

Nicholson and sold in greater quantities than any other Swiss or Swiss Type brand.

These widely preferred Swiss Pattern Files are now again available in nearly all kinds, through industrial hardware distributors.

Nicholson X. F. Swiss Pattern Files are made for every one who does extra-fine filing, for tool and die makers, delicate instrument-parts finishers, model makers, hobbyists-precision craftsmen in general.

More exacting measurements—smaller points and longer tapers... there are features that distinguish X F. Swiss Pattern Files from American Pattern (see examples in above illustrations). Highest quality—uniformity in each detail of manufacture—and the sweeping guarantee of Twelve perfect files in every dozen... there are factors that make them the first rhoice of most precision-file users.

12,000 Holes per Hour! With New Gearless Multiple Spindle Drillhead!

The Zagar Gearless Drillhead can accommodate up to 400 drills in one head—drill up to 400 holes at one time! This revolutionary unit runs noiselessly and vibration-free on needle, tapered toller and precision ball bearings, and is lubricated by a patented automatic oiling system to insure trouble-free operation.

With this unit all holes are drilled at one pass, and valuable time is saved by the elimination of indexing and extra handling. It may be used on standard drill presses, or furnished as a complete hydraulic machine by the factory.

Another time saver, as well as a help on a tedious job, is chewing gum. The simple act of chewing seems to make the work go faster, easier—helping to relieve worker's fatigue—so that a better piece of work can be turned out with greater safety. Wrigley's Spearmint Gum may be used even when both hands are busy—right where the work is being produced.

Leash Has Automatic Reel

To simplify control of a dog, the Promenader leash has a thumb-operated brake that checks it at any length and a reel that automatically rewinds the 10-foot plastic cord when the pull is removed. The Inventors Products Corp., of Chicago, makes it.

Bicycle Gets Extra Wheels

THE convertible bicycle devised by Clyde Kutil, of Sioux City, Iowa, can be changed to a "quadricycle" by merely pulling a lever. The two extra wheels at the rear drop to the ground, giving greater stability for beginners or handicapped persons. The same lever raises the wheels when they are no longer wanted.

A storage battery, like a water tank, can deliver only what it contains. The quantity of current it can supply is gauged by its capacity—voltage multiplied by amperage.

VOLTAGE means pressure of electric current, just as "pounds per square inch" indicate water pressure. AMPERAGE measures the flow of electric current per hour, just as "gallons per minute" measures water flow. CAPACITY means the quantity of electricity delivered in a definite time.

The faster a battery is discharged, the quicker the pressure drops. More current is consumed in cranking (starting) than in lighting, and power is more quickly exhausted. This is clearly shown in the illustrations above.

Thus capacity is an important factor in determining the power and quality of a storage battery ... and the kind of service it gives you.

Exide Batteries are noted for their high capacity, long-life, low cost per mile of operation and strong starting power.

TOUGH on our remember GENTLE on eventures wants

Here it is ... the clinical recording camera. Developed by the Army Signal Corps for the surgeons of the Medical Department, it can "stop" an intricate operation with a silent, built-in flash lasting 1/25,000 of a second!

Best of all, it can take a consecutive stream of stills without interfering with the progress of the surgeons. Successful solutions of unique surgical problems can now be preserved in picture-story form—in color—for medical personnel throughout the Army, and for civilians as well. The importance of this camera to the future of surgery and the saving of lives can hardly be overestimated.

This is but one post-war stride of the new Regular Army. The civilian fields of tomorrow-such as Radar, Nuclear Energy,

YOUR REGULAR ARMY SERVES THE NATION AND MANKIND IN WAR AND PEACE

Supersome Aviation, Advanced Electronics, Jet Propulsion — are the fields of today in the Army!

Combine exciting opportunities in these fields with the merits of an Army career, and you've an education that's hard to beat. New higher pay, liberal leave and retirement benefits, and the chance to choose your branch of service from those still open (on 3-year enlistments) make this a job you can't afford to miss! See your nearest Army Recruiting Officer for full details.

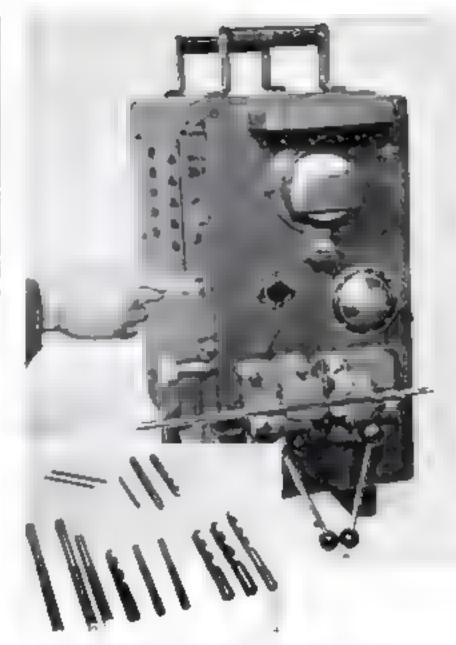

Listen to: "Sound Off," "Warriors of Feace," "Yelce
of the Army," and "Fraudly We Hall" on your radio.

Portable Flash Butt Welder

A PORTABLE, automatic welder produced by the DoAll Co., of Minneapolis, is designed for production welding of bar and round stock up to 5,16" diameter. Its uses include the repair of small tools and welding of tool-bit extensions. The entire welding cycle is controlled by a single push button. Other special features include a built-in grinder and an automatic motor to control the feed of materials. An etching attachment provides a means of permanently identifying tools, dies, and fixtures. The model is designed for standard AC 220-volt operation, but it can be supplied for other voltage requirements.

Champion spark plugs for model gas engines give the same dependable performance as regular Champions. Sillment scaled. Sillimanite insulator. Alloy needlepoint electrodes for easy starting. One piece construction.

CHAMPION

SPARK PLUG COMPANY . TOLEDO 1, OHIO

PREPARE your car for winter driving by having your dealer check your spark plugs now. If they have lost their efficiency, insist on new Champion Spark Plugs. They will insure instant starts in coldest weather, faster warm-ups and smoother engine performance. Champion dealers everywhere will serve you with the correct size and type for your car to insure maximum efficiency and economy. Snap into winter with dependable Champion Spark Plugs.

"EVEREADY" FLASHLIGHT BATTERY LASTS 93% LONGER!

Tiny cell packs enough ENERGY to kick 186 field goals

Like football? Like to sit breathless while the Big Team goes into kick formation for a lastminute try? Then here s news: The great new "Eveready" flashlight cell NOW has energy equal to that used in making 186 big-time held goals from the 25yard line! Extra power makes "EVEREADY" batteries the All-American choice for brilliant. lusting, low-cost light!

THE NEW "Eveready" flashlight cell literally blasts darkness with a dazzing beam of powerful white light. And does it for nearly twice as long as famous prewar "Eveready" batteries. Because this new cell packs 93% more energy! Service from "Eveready" flashlight batteries is nearly doubled ... yet you pay no more for this far greater value! For longer life of brighter light... get these new "Eveready" flashlight batteries!

Concealed Projection Screen

A HOME projection screen that is in effect an oil-painting reproduction when not in use has been developed by the Radiant Mfg. Corp., of Chicago. The screen, of glassbeaded material, is concealed in the upper part of the frame.

Magnetic Metal Analyzer

Using the relationship between magnetic and metallurgical properties, the Ferrograph speedily determines the composition of ferromagnetic materials by electrical analysis. Developed by the Allen B. Du Mont Laboratories, of Passaic, N. J., it has a cathode-ray indicator that permits examination of the induced voltage in the secondary of a transformer in which the sample under test is the core. The apparatus simplifies industrial tests by unskilled workers, who have only to compare the machine's indication with known values.

Gauge Has Nonwearing Blocks

Incorporated in a new snap gauge, the special gauge blocks shown above give the instrument nonwearing qualities. Colored plastic insulators, green for "go" and red for "no-go" combinations, are held over the jaws by plastic pins. It is made by the Dearborn Gage Co., Dearborn, Mich.

Pocket-Size Folding Stand

For musicians, stenographers, or anyone else who needs something to prop papers against, the J. B. Steven Products Co., of New York City, has designed the Handi-Stand, a compact rack of lightweight magnesium. Folded, it fits a pocket.

BETTER BY FAR

TURRET TOP, pioneered by Fisher Body, is formed of a single sheet of solid steel.

U-SHAPED STEEL ROOF BOWS are fused to the steel roof rails, affording extra ruggedness and shock resistance.

You'd know what we mean if you could watch one of these Fisher Bodies come down the assembly line.

Then you could see the extra steps we take to make them durable and rugged -- how added strength and safety are built in by such features as you see listed at the right.

Your eyes tell you the new bodies by hisher are beautiful when you see them on the road. And your knowledge of good craftsmanship will tell you they're "better by far" through and through, and that cars with Body by Fisher are well worth waiting for.

STEEL COWL AND DASH, TUDgodly broced with a triangufar trus construction, provide solid support for the front door hings pillar,

Outer and Inner DOOR PAMELS are welded into one solid unit.

SOLIO STEEL FLOOR, especially ribbed for extra strength. forms the foundation of the Unisteel Turret Top Body by Fisher.

BOX-TYPE REAR END BRACES give extra protection against weaving and twisting.

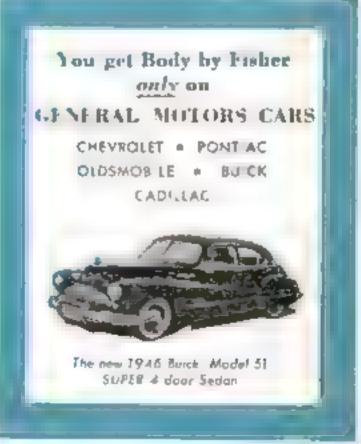

PLUS a long list of other features in design and construction, which would total more than a hundred.

34-Pound Portable Recorder

Newest in recorders is the 34-pound machine that New York radio station WOR recently imported from England. Driven by its own spring-powered motor, which is similar but superior to the old phonograph type, it cuts a record in three minutes at 78 r.p.m. British Broadcasting Corporation correspondents used it at the battle fronts.

Hide-Away Hearing Mold

NEARLY invisible and formed of plastic, the newly developed Hide-Away Ear Mold worn by the model fits any modern hearing aid, according to its distributors, the Universal Distributing Co., of Davenport, Iowa.

Hand Metal-Hardness Gauge

A NEW hand-operated, portable gauge for determining variations in the hardness of aluminum and its alloys, and another for testing copper, brass and other nonferrous metals, are introduced by R. A. Webster, a Santa Monica, Calif., company The instruments look and operate alike Squeezing the handles actuates a penetrator, and a meter shows the hardness of the material being tested. The penetrator's real pressure is applied by a spring load unrelated to the pressure put on the grips of the

gauge, assuring consistent readings. Both models are equipped with cylindrical anvils that allow testing of strips, sheets, tubes or extrusions with a single tool.

Tests Tension of Textiles

For testing the tensile strength of cord, yarn or thread up to 100 pounds, Walter Kidde & Co. Belleville, N. J., has devised the "tensometer" shown above. The instrument can be chipped onto moving, continuous textile filaments and measures tension directly in pounds.

Adjustable Drop-Cord Reel

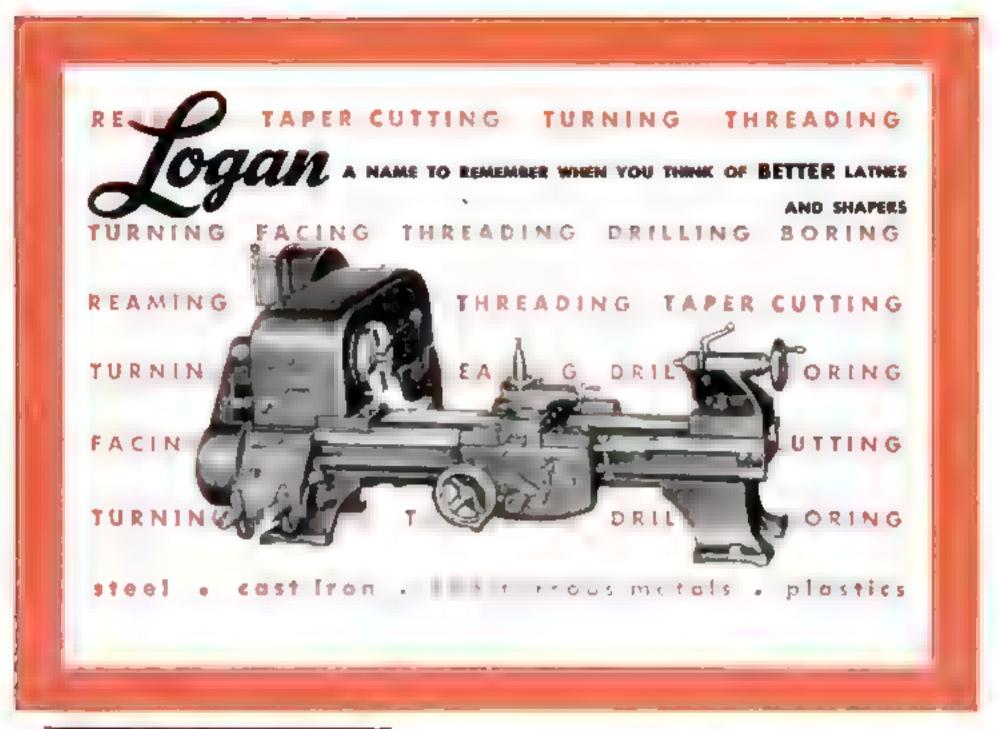

WITH this drop-cord Reelite it is only necessary to pull the cord to adjust the light at the desired height over a workbench or near a hard-to-see job. It contains a 12-foot, rubber-covered cord. Appleton Electric Co. makes the device.

Home and Workshop Index Provides Quick Reference

WITH a copy of the new Home and Workshop Index, you can quickly find any article that you may remember seeing during 1946 on the craftwork pages of Popular Science Monthly. All articles that appeared from January 1946 to and including December 1946 on craftwork, woodworking, house repairs, new shop ideas, radios, automobiles and related subjects are listed.

To obtain your copy, send a dime to Popular Science Home and Workshop Index, 353 Fourth Avenue, New York 10, N. Y., enclosing a self-addressed, stamped legal-size envelope (No. 10), A limited number of 1941, 1942, 1943, 1944, and 1945 indexes are still available. Send 10 cents for each copy you wish, specifying the year.

compact Logan Lathe performs variety of work with speed, ease and accuracy

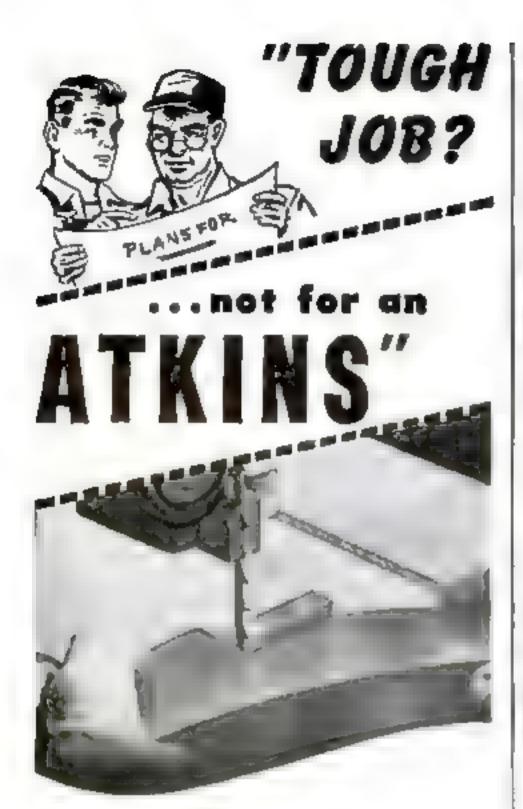

9 reasons why LOGAN Lathes are BETTER lathes

- RALL BEARING HEADSTOCK
- 2 RUGGED, ACCURATE BEB within .0005" of parallelism,
- 3 SELF-LUBRICATING BEARINGS of vital points lengthen life.
- 4 BACK GRARS EMITIONS
 IN HEADSTOCK
 with shifter rack safety and conveniently
 at your finger fips.
- 5 BUBBER CUSHIONED COUNTERSHAFT for smoothness and accuracy in working area.
- 6 THREE POINT SUPPORT Steadles the countershaft, prevents
- 7 INCLOSED BILTS, GEARS, PULLITS
- Prevents occidents. Keeps lathe clean.
- Makes belt changing easy and safe.
 PRECISION BUILT THROUGHOUT
 For tool room accuracy in your shop.

The qualities which make the Logan Lathe a successful industrial tool are equally effective in the small shop. The wide variety of operations which can be handled on one Logan Lathe is an important advantage to the small shop owner. Designed for compoctness as well as for efficiency, the Logan Lathe occupies a minimum of floor or bench space. The ball bearing mounted spindle requires no adjustment from 30 to 1450 rpm and permits use of high speed carbide cutting tools. Conveniently located levers and hand wheels enable the operator to work in safety and comfort and without fatigue. Rugged construction throughout, and self lubricating bronze bearings at vital points insure

WRITE FOR THE LOGAN CATALOG ... complete illustrated descriptions of Logan Lathes, Shapers and Accessories. LH-9

lasting accuracy and low maintenance.

Complicated patterns are no problem to the man using Atkins "Curled Chip" Band Saws. He knows the extra cutting ability in "Silver Steel" blades with "Skip Tooth" design . . . knows how rapidly and smoothly they glide through material . . . knows how easily they can be guided around the "trickiest" contours.

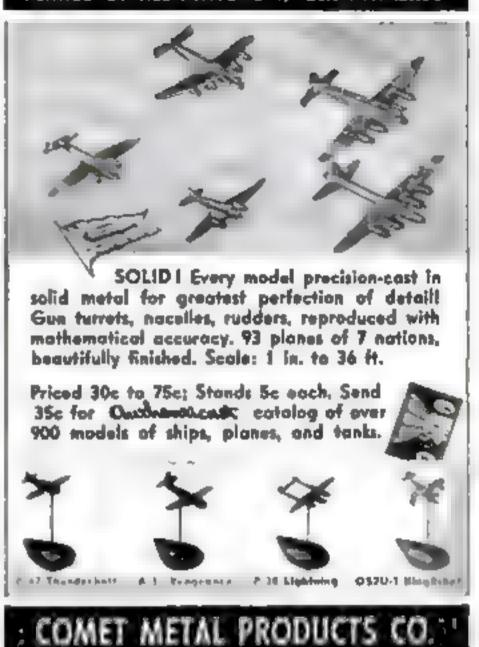

In fact, every Atkins saw is a star performer on the job for which it is intended. That's why present production of all types is still below demands. Your dealer has done his best to keep you supplied with Atkins products—we're making every effort to help him

Helium Test for Vacuums

Developed to test vacuum systems used in atomic research and electronic and chemical processes, a new Westinghouse device detects the most minute leaks. In operating the apparatus, helium gas is blown on the equipment to be tested. If there is a leak, the helium gas is drawn into the vacuum system and is detected instantaneously by an electronic tube in the meter box at lower left in the picture. The amount of helium detected by the electronic tube is shown on the dials of the meter box, indicating the size of the leak.

Jack Supplants Trailer Blocks

ELIMINATING the chore of propping up auto trailers with blocks, the Persson trailer jack provides a foundation on any soil. For leveling, a jackscrew is adjusted after the eight-pound support is in position.

Self-Adjusting Shoe Holder

A SHOE holder that slips into a wall bracket has been developed by the David Shine-Stick Co., of St. Paul. Self-adjusting springs keep shoes flat on the holder, climinating the need for shoe trees. Neoprene pads protect heels and toes.

Keeps Decoys Right Side Up

A KEEL designed to keep duck decoys upright in rough water is manufactured by the Mt. Clemens Specialty Co., of Mt. Clemens, Mich. If the decoy upsets, a trigger drops and allows the keel to fall on one side of the decoy's base, causing it to right itself and thus reset the trigger.

McLAREN INDUSTRIES, INC., Box 606, TROY, M. Y.

BURN WATER IN YOUR CAR

MORE POWER ● FASTER PICK-UP CLEANER, COOLER, SMOOTHER MOTOR • GOOD MILEAGE ECONOMICAL, TOO.

WATER INJECTION, once a top military aviation secret for fighter-craft airplane engines to increase horsepower and speed; to decrease fuel consumption, keep engines cooler, cleaner, more carbon-free, is now available for Cars and Trucks in the VANDERPOEL WATER INJECTING CARBURETOR.

Onickly and easily installed between air cleaner and gasoline carburetor, the VANDERPOEL automatically injects a regulated and controlled amount of water, or alcohol-water (for winter) through air-horn of the gasoline carburetor and into the air stream, thus combining ... with fuel-air mixture.

DECLARED GREATEST AUTOMOTIVE IMPROVEMENT SINCE 4-WHEEL BRAKES

Your car performs better at night or during a rain because Water Vapor, in mixture with the air and petroleum gases, acta as an internal coolant, reducing high temperatures and peak pressures, suppresses detonation, ("ping") and presignition, permits advanced timing, increases combustion time period of the fuel, dissolves gummy carbon deposits, keeps spark plugs clean, reduces fuel consumption, and produces higher power output from the engine.

ASK YOUR DEALER

ASK for literature. ASK to see the VANDERPOEL ALL Service Stations, Garages, Tune-ups, Tire, Car, Truck, and Tractor Dealers Everywhere in the United States can sell and install the VANDERPOEL

(If your dealer can not serve you, order direct. Mail post-card for literature.)

WANTED IMMEDIATELY 500 MEN WITH MECHANICAL ABILITY AS DIRECT, FACTORY, WHOLESALE DIS-TRIBUTORS TO HELP US SERVICE THOUSANDS OF RETAIL OUTLETS. PLEASE WRITE.

Locomotive-to-Station Phone

Engineers on moving trains can speak with stations as much as 50 miles away with the Aireon radiophone, above. The locomotive's headlight generator can be tapped for power. The handset has a rubber cap over the earpiece and a "hp" microphone that transmits the voice only. Volume controls are alongside the handset. Auditory signals from the receiver, plus "send-receive" lights, warn when a party is calling. The set operates on a frequency of 70-200 kilocycles.

New Carbide Lathe File

This two-sided, carbide lathe file, devised by Carboloy Co., fits into an aluminum holder. The 4- by %-inch file insert is single cut, 34 teeth to the inch. When one face is worn, insert is turned over.

KIDNEYS MUST REMOVE EXCESS ACIDS

Help 15 Miles of Kidney Tubes Flush Out Poisonous Waste

If you have an excess of acids in your blood, your 15 miles of kidney tubes may be over-worked. These tiny filters and tubes are working day and night to help Nature rid your system of excess acids and poisonous waste.

When disorder of kidney function permits poisonous matter to remain in your blood, it may cause nagging backache, rheumatic pains, leg pains, loss of pep and energy, getting up nights, swelling, puffiness under the eyes, headaches and dissiness.

Kidneys may need help the same as bowels, so ask your drugglet for Doan's Pills, a stimulant diuretic, used successfully by millions for over 40 years. Doan's give happy relief and will help the 15 miles of kidney tubes flush out poisonous waste from your blood. Get Doan's Pills,

Light, Safe Magnesium Boat

AIRCRAFT construction marks the Dowcraft magnesium boat, which weighs only 45 pounds although 12 feet long. Of ribless design, the craft has an extreme beam of 44% inches and a center depth of 16% inches. An added safety factor is given by Styrofoam floats installed under each of the three seats. The boat holds five persons and its stern can support a 5%-hp, outboard motor.

All-Pattern Garden Sprinkler

ADAPTED from sprinkler heads used in parks, the home sprinkler above can be adjusted to throw water in any pattern of angles and curves. Spray can thus be kept off house walls and sidewalks. The circular, revolving plate above the nozzle has 18 vanes. Each vane can be lowered, raised, or twisted to control the distance that the water travels.

Tuned Air Column Tortures Metals to Test Strength

UTILIZING the principle of a slide trombone, General Electric engineers have developed a new method of fatigue-testing metals and alloys with a compressed-air machine. A stream of air causes metals to vibrate at their natural frequencies until they crack or break under the strain. The necessary vibration rate is attained by altering the length of the air column, just as a trombone player changes the tone of his instrument.

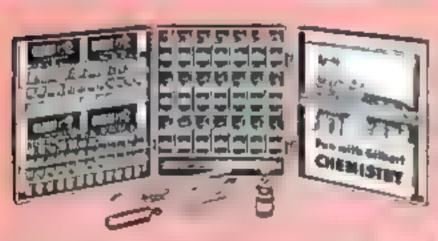

In operation, the metal or piece of equipment being tested is attached to a piston that fits loosely into two exhaders. The compressed air is directed through the cylinders and tuned to vibrate at the natural frequency of the metal. An optical system measures the amount of vibration, and an electric meter at the base of the machine records the resonating frequency of the metal under test.

The machine permits tests at temperatures as high as 1,700 degrees F., so that even the metal buckets of gas turbines can be checked under the conditions in which they actually operate. The new system is said to be the most rapid yet known for fatigue tests and is expected to bring wide changes in that field.

More boys have won fame and big awards with Gilbert Chemistry Sets than any other kind. Because they are far more than "toy" Range of chemicals and apparatus are based on real laboratory technique. Write messages in in-

visible or fire ink. Make chemical weather flag. Bleach flowers. Make paints, sparklers, soda water. Hundreds of other spectacular experiments in organic, inorganic and electro chemistry.

Big, three-compartment bide metal cabinet crammed with chemicals and apparatus Pois 389 spectacular experiments at your finger tops,

ALL THESE ADVANCED FEATURES

NEW -- All metal construction -- rugged and easy to carry.

NEW-Each section designed as complete laboratory with trays and racks.

NEW -Tip racks for test tubes, for easier handling of test tubes

NEW-Brown, lightproof bottles such as used for fine pharmaceuticals.

NEW-Rectangular shaped bottles and shelf spaces, holding bottles with label side out.

NEW—Postwar chemistry book. 144 pages profusely illustrated; large type. 8" x 10" page size and scay-open binding. Edited by Prof. Treat B. Johnson, distinguished Yale professor, author of hundreds of publications in the field of organic chemistry, member of the National Academy of Sciences, the National Research Council, the American Chemical Society, the American Institute of Chemists, and other scientific organizations.

WINS \$100.00 FOR

XIIII III S

Meet Frank Hoble of Chicago, America's No. 1 boy chemist of the year, who won a check for \$100 00 and national fame for out standing research. The way is wide open for you to do the same. But he sure to start right—with a genuine Gibert Chemistry Set.

\$200.00 IN CASH AWARDS

To the boy doing what in my opinion, is the most important research in Chemletry, Microscopy or Electricity in 1947, I will award \$100 00 in cash. To the tenboys doing the next most important research, I will award \$10.00 each. Applicants must not be over 17 years old and must send me a full description of their experiments by May 1, 1947.

Gypsy Radio Laboratory

Radio is mushrooming, and to ease its growing pains General Electric has out-fitted eight roving radio laboratories to find the best sites for new transmitters. One of the perambulating labs is shown at top. Under it is a photo of its interior. The laboratories will operate out of Boston, Philadelphia, Albany, Atlanta, Cleveland, Chicago, Kansas City and Dalias.

Weeder Gets at the Roots

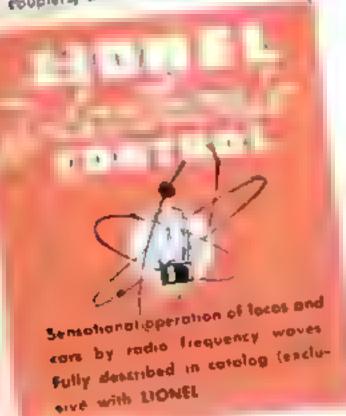

BETTER—and easier—weed-killing is promised by the new, three-foot-long weeder, above, made by the S K G Corp., of Minneapolis. It is operated by thrusting its forked blade under a weed to sever the roots. The spring-action trigger under the handle is then snapped and the claw closes on the weed to grip it when the blade is pulled out of the ground.

What Do a Physicist and a Mechanic Have in Common?

IT TAKES all kinds of men to make a million readers. One of Popular Science Monthly's best friends and keenest critics is an astrophysicist-star-snooper to you and me. He started to read PSM for relaxation, soon discovered he was getting painless information in fields of science other than his own specialty.

Another regular reader I happen to know personally is one of the smartest mechs who ever cocked an ear at an ailing motor and went right to the valve seat of the trouble. He goes for "Gus" first thing. I asked him why. He said, "It's like a puzzle-I try to solve it before Gus does. Sometimes I do; sometimes I pick up some dope I didn't know; and I'm still hoping to catch that guy off base."

Significantly, the scientist who starts PSM from the front betrays a conversational famili-

ROBERT PRESLEY STEVENSON got an early start toward PSM when, at 14, he sold an article about a bird-nesting box to a farm magazine. After graduating from Penn State, he worked for the Associated Press for

seven years. He found life exciting as a New York rewrite man but it left him little energy to enjoy a workbench or darkroom. So he eventually came to PSM, where he can think about the things he enjoys. Once an artist insisted that a gadget wouldn't work if made as shown. Stevenson came in the next morning with the gadget, built as specified. It worked.

arity with the new tools and smart gadgets. And the expert mechanic seems to know what is going on in electronics and chemistry. Which shows that one man's end is another's beginning so far as PSM is concerned.

To me, it is quite understandable that so

ROBERT GORMAN, during his last year at New York's City College, tried to promote the price of a Grand European Tour by ghostwriting. In a few years be earned for others enough degrees to stock a university and

anonymously authored half a dozen books. Then side ventures left him with one pair of pants and a resolution to stick to writing. He did, until Uncle Sam gave him another pair of punts-olive deab. He returned to civilian life as editor of an encyclopedia and then came to PSM. The Army taught him where electrons go when they leave home, and this love filters into PSM. He is also expert with saw and hammer, as some slick modern furniture in his apartment testifies.

many hard-handed characters, who didn't finish school, end up grinding their own telescope lenses and studying trigonometry; that so many professional scholars turn out handy with a hammer. For the Ph.D. and the Joe D. have a lot in common.

Both have a deep appreciation of good workmanship, an affection for materials, a

MARTIN MANN had an enthusiasm for photography that led him to specialize in opties at MIT, but didn't overshadow an early interest in journalism. The ink was hardly dry on his physics degree when Pearl Har-

bor took hun away from his first civilian job, designing artillery fuses, and put him into uniform. He spent most of the war writing and helping produce training films in the Army Air Forces, which incidentally gave him an inside look at Hollywood. He left the Army a cuptain and joined PSM shortly after.

respect for tools. Hal Borland, in this issue, brings them together at the workbench; PSM, in every issue, brings them together in their minds. For what really links these two kinds of men so different in occupation and so alike in taste is a fundamental curiosity about things—what makes them tick, how they are made, how they might be adapted to some other problem.

In fact, I like to think of PSM as a handbook for scientists who use their hands, and mechanics who use their heads. I don't care which end of the train they

get on. They are going to the

same place.

294 SCIENCE

RCA Victor "Eye Witness" television receiver shown above gives you 52 square inches of picture brilliance.

A referee's eye view of every play - by Television!

You feel as though you were right there at the game—when you see it through RCA television.

Football fans as far as 250 miles away from the stadium have enjoyed watching many of the big games this fall through NBC telecasts. And football fans become television fans when they see how closely the camera follows the ball.

After you've tuned in the game, the RCA Victor "Eye Witness" Picture Synchronizer automatically "locks" the picture in tune with the sending station—and assures you of brighter, clearer, steadier pictures.

For television at its best, you'll want the receiver that features the most famous name in television today—RCA Victor.

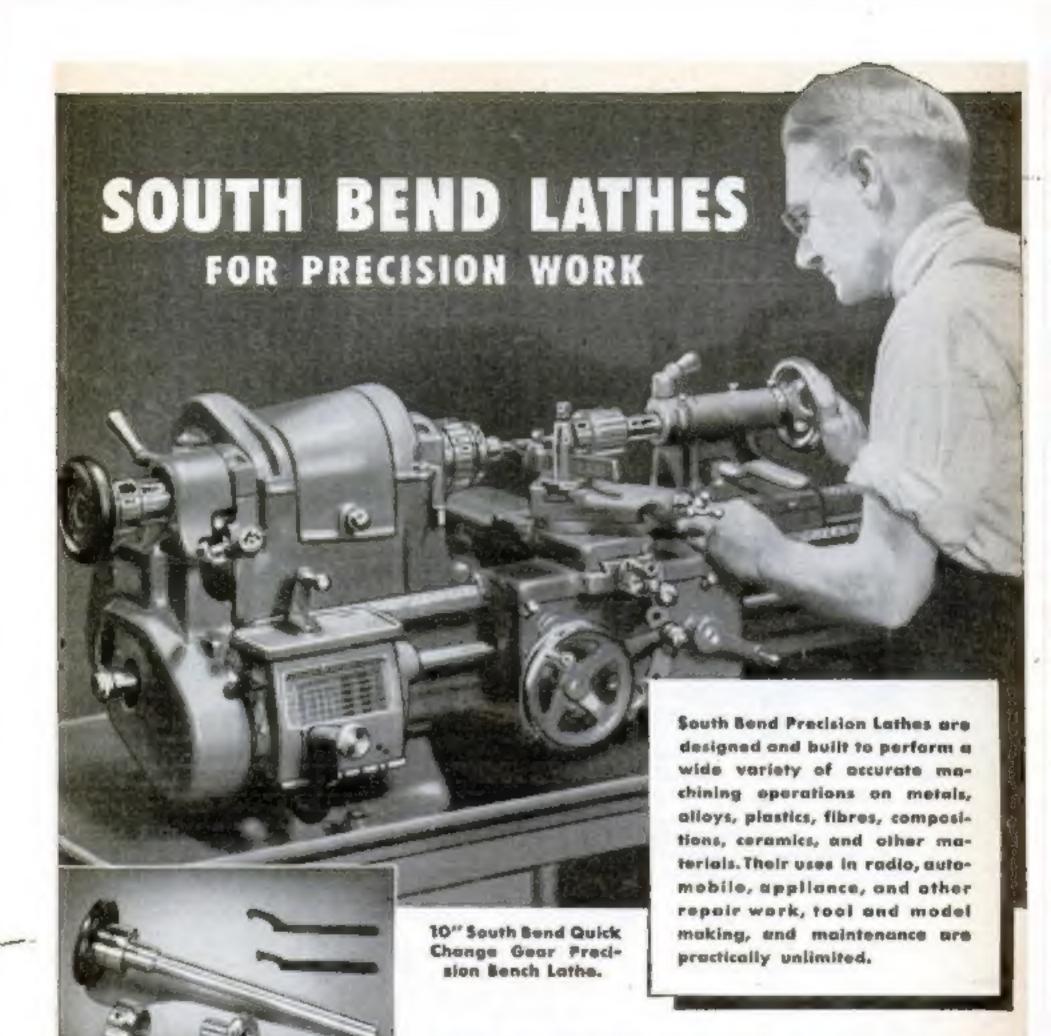

Radio Corporation of America, RCA Building, Radio City, New York 20, N. Y.

RCA Image Orthicon television camera enables television to go anywhere now by freeing it from the need for strong lights or bright sunshine.

RADIO CORPORATION of AMERICA

of this Cover

LIMAXING its achievements in adult education, the NATIONAL EDUCATIONAL ALLIANCE now announces a new streamlined Course Mathematics especially designed to answer the thousands of urgent peacetime calls for mathematically trained men in virtually every field!

On work bench, in drafting room; in the laboratory; in tool, die and pattern making; in

construction and engineering of all kinds; there's hardly a field where a math-ematically trained man basn't a de-cided advantage. He gets the better ob-bigger pay-earns promotion more quickly-and will come out shead in America's coming indus-

Thin New N. E. A. Course in Mathematics makes it possible for the average person to acquire—in only a few months—a practical working knowledge of all 25

branches of mathematics and their practical applications. It comes to you complete in four volumes filled with illustrated fascinating lessons designed for home study.

You receive instruction from 28 foremost sities. Each instructor has been selected because of his special knowledge of a particular branch of mathematics and because of his ability to simplify and streamline his instructions.

Over 600 Helpful, Graphic Pictures and Diagrams! Nearly 1300 Pages!

No previous mathematics knowledge is needed under this ingenious teaching plan. You start with Basic Arithmetic and proceed by advanced branches of mathematics.
You'll learn how to use Algebra for short

cuts in daily shop problems, in construction work, in tool and die making, in welding, abeet metal work and pattern making, in office and laboratory. You'll learn how to apply Geometry in chemistry, mechanics, electricity and radio, in the drafting room, You'll learn how to employ Trigonometry in gearing, lathe centers, blueprints, die punches, stc.; in range finding, aviation, pavigation. You'll learn how to utilize Calculus in the design and production of ships, dams, bridges,

You'll learn Practical Applications that you can use to win advancement and bigger pay!
